Burden of proof, in *law*, the obligation resting upon one of the parties to an action to establish an alleged fact by proof, under penalty of having judgment given against him, according to the presumption recognized by the law of evidence in case he adduces no proof. The burden of proof is said to be shifted when the party upon whom it lay has produced sufficient evidence to turn the presumption in his favor. Two circumstances are essential to the existence of a burden of proof: first, there must be a question of fact between two parties before a tribunal which will render a decision whether there is any particular evidence or not; and second, this decision must be governed by rules of presumption, more or less artificially extended so as to lead to a determinate result in every case. In unforensic controversy there will or will not be a burden of proof, according as these conditions are or are not fulfilled. In reasonings, as contradistinguished from disputations, if they relate to policy, there is nothing to which the term *burden of proof* is applicable; for the decision will be based on considerations of likelihood, economy, safety, etc., but never on formal rules of presumption. A general habit may be followed when decided reasons fail, in questions both of policy and of morals; but the phrase *burden of proof* is not employed in such cases. A speculative or scientific inquiry, on the other hand, cannot be closed until satisfactory evidence has been obtained or curiosity dies out; so that the term *burden of proof* has no meaning in such a connection. Yet an individual reasoner who, being impatient of doubt, insists on adopting an answer to each question, however blank our ignorance of the facts, must often resort to a merely formal presumption; and such persons say that there is a burden of proof upon any possible advocate of the hypothesis which they propose to reject without proof. The term is also used in cases where the absence of observations of a certain kind is itself a significant fact. Thus, we may say that there is a burden of proof upon the evolutionists to explain our not finding forms intermediate between recognized types; that is to say, the non-occurrence of such observations is a fact to be taken into account. =**Syn.** Weight, incumbrance, clog, incubus, drag; freight, lading, cargo.

III. *conj.* **1.** Except; unless: after a clause containing or implying a negation, and introducing the following clause, in which (the verb being usually omitted because implied in the preceding clause) *but* before the noun (subject or object of the omitted verb) comes to be regarded as a preposition governing the noun.

In this construction the negative, being implied in *but*, came to be omitted, especially in connection with the verb *be*, in the principal clause, the construction "There is *not but* one God," as in the first example, becoming "There is *but* one God," leaving *but* as a quasi-adverb, 'only, merely, simply.' This use is also extended to constructions not originally negative.

To the last two constructions, respectively, belong the idioms "I *cannot but* hope that," etc., and "I *can but* hope that," etc. The former has suffered ellipsis of the principal verb in the first clause: "I cannot do anything but hope," or "anything else than hope," or "otherwise than hope," etc., implying constraint, in that there is an alternative which one is mentally unable or reluctant to accept, *but* being equivalent to *otherwise than*. The latter, "I *can but* hope that," etc., has suffered further ellipsis of the negative, and, though historically the same as the former, is idiomatically different: "I can only hope that," etc., implying restraint, in that there is no alternative or opportunity of action, *but* being equivalent to *only, not otherwise than*, or *no more than*.

NGr. *βυτίνα*, a pan for salting meat). As in other vessel-names, the precise application varies in the different languages. In the sense of a particular measure of wine, the word is modern; cf. *pipe* in similar senses.] **1†.** A leathern bottle or flask; a bucket: in this sense only in Middle English, usually spelled *bit* or *bitt.*

2. A large cask, especially one to contain wine.—**3.** A measure of wine equal to 126 United States (that is, old wine) gallons; a pipe. It is no longer a legal measure in Great Britain, and the common statement that an imperial butt is 126 imperial gallons is incorrect; the butt is 110 imperial gallons. The measure was originally used chiefly for Spanish wine, and the word was used to translate Spanish *bota*, which equaled 126 United States gallons, and to distinguish that from the Spanish *pipa*, which contained only 114 United States gallons. Its present value was legalized by a statute of Anne. It is now confounded with the *pipe.* The pipe of Madeira is reputed to contain 110 gallons; of Canary, 120; of Port, 138; of Marsala, 112. The *bota* and *pipa*, throughout Spain, vary but little from the values above given. In Portuguese countries two measures are common, one of 141 gallons (Oporto, Lisbon for oil), and another of 110 gallons (Lisbon, Madeira, Porto Rico, Bahia). There is besides a Portuguese pipe of 132 gallons (Lisbon for oil, Bahia). In Italy the name *botte* is applied to a cask holding 200 United States gallons or more; but it was in many places confounded with the *pipa*, which held only 160 to 170 gallons. The French word *botte* was never used as the name of a wine-measure; neither was the German *butte* or *bütte.* In Denmark there was a *bodde* of 123 United States gallons; in Gotha, a measure of the same name equal to 115 United States gallons. The *botija* of Bolivia is only 9.3 United States gallons. A butt of London beer, at the time when London beer was measured differently from ale, was 3 hogsheads. A butt of salmon, by a statute of Henry VI., was 84 gallons.

butte (būt), *n.* [F., a rising ground, a mound, orig. a butt to shoot at: see *butt*[2].] A conspicuous hill or mountain, especially one that attracts attention by its isolation, or serves as a landmark: a name applied in the regions about the upper Missouri and west to the Pacific. Thus, the "Three *Buttes*" were a conspicuous landmark for emigrants to Oregon. One of the highest and grandest mountains in the United States, Mount Shasta, was in the early days of Californian emigration known to the Americans almost exclusively as Shasta *Butte*. Other prominent lofty peaks in California are still called *buttes*, as Downieville *Buttes*, Marysville *Buttes*, etc. This use of the word *butte*, now gradually disappearing from the region in question, is a relic of French occupancy of the Northwest, and of the subsequent wide distribution through that region of the Hudson's Bay Company's employees, most of whom were of French extraction. The word was picked up by overland emigrants and carried to the furthest West; and it has been much used as a place-name, alone or in combination.

It is used as a food or relish by most peoples, and is made directly from the milk, or from the cream previously separated from the milk, of cows, goats, and other animals. Agitation or churning separates the fats from the milk or cream and makes them cohere in lumps, which are then worked together, freed as far as possible from buttermilk, and usually mixed with salt, which preserves the butter and develops its flavor.

S. Dispensatory, p. 1049). *Canara butter* is obtained from the fruits of *Vateria Indica*; it is a resin rather than an oil, and is used as a varnish. *Fulwa butter* is from the seeds of the East Indian *Madhuca butyracea*; *Kokum butter*, from the seeds of *Garcinia Indica*; *Mahwah butter*, from *Madhuca Indica*. *Shea butter*, also called *galam* or *Bambuk butter*, is from the kernels of the shea-tree, *Butyrospermum Parkii*, of western Africa; it resembles palm-oil, but ★is of a deeper-red color. Byzantium was founded by a Greek colony in the seventh century B. C., but was of no great importance until A. D. 330, when the emperor Constantine the Great made it his capital, and changed its name to Constantinople, after himself.—**Byzantine architecture**, a style of architecture developed from the classical under the Byzantine empire during the fourth and fifth centuries A. D., and, under various modifications, used till the final conquest of

that empire by the Turks in A. D. 1453. It spread so widely that its influence even in Italy did not wholly decline before the fifteenth century, and it may be considered as surviving still in Russian architecture, and in a less marked degree in other eastern lands. An almost universal feature of the style, in buildings of any pretension, is the incrustation of brick or rough stonework with more precious materials; large spaces are left void of bold architectural features, to be rendered interesting merely by surface ornament of polished marbles presenting natural beauty of hue, or of sculpture in very low relief, and confined in the main to vegetable or geometrical designs of clearly cut outline. The style depends much on color for its effect, and mosaics wrought on grounds of gold or of positive color are profusely introduced. The leading forms which characterize the Byzantine style are the round arch, the circle, the cross, and the dome supported upon pendentives. The capitals of the pillars are of endless variety, and full of invention. While some are plainly founded on the Greek Corinthian, many resemble those of early round-arched western architecture; and so varied is their decoration that frequently no two sides of the same capital are alike. The ancient basilica of St. Sophia, in Constantinople, and the church of St. Mark, in Venice, are classical examples of Byzantine architecture.—**Byzantine historians**, a series of historians and chroniclers of the affairs of the Byzantine empire, scattered through the whole period of its existence. They are our only source of knowledge of Byzantine history. Their works have been several times printed complete in the original Greek, the latest edition being by Niebuhr and others, in 48 volumes.

★

1. The third letter and second consonant in the English, as in general in the other alphabets derived from the Phenician. The value of the sign, however, in Phenician as in Greek, was that of a hard *g* (in *go, give*); and so also originally in Latin, beside the sign *k*, which had the proper *k*-sound. But the Latins gave up for a time the written distinction of the *k*-sound from the *g*-sound, writing both with the same character, *C;* and when later they readopted the distinction, instead of reducing *C* to its original value, and restoring *k*, they retained the *k*-value for the *c*, and added a tag to the same character for the *g*-sound, thus turning *C* into *G*. The comparative table of forms, like that given for the other letters (compare *A* and *B*), is as follows:

Egyptian. Hieroglyphic. Hieratic. Phenician. Early Greek and Latin.

Great as is the apparent difference between Greek Γ and our C, it is due only to a shifting of the position of the angle made by the two component lines, and the rounding of this angle. The hard or *k*-sound which belonged to this character in early Latin belonged to it also in Anglo-Saxon (which, like Latin, made little or no use of *k*). But this *k*-sound, as being a guttural or back-palatal mute, is particularly likely to be shifted forward along the tongue and to be changed into front-palatal and sibilant sounds, especially before vowels like *e, i, y*, which favor the front-palatal position. Hence it comes that *c*, still so written, is pronounced as *s* in English before *e, i, y*, and elsewhere as *k*. But this "soft" or sibilant *c* belongs to the French part of our language; the Anglo-Saxon *c*, when softened, gets the sound usually represented in English by *ch*, and is so written: for example, in *chicken, cheese, church, birch, teach*. (See *ch*, and *assibilation*.) No word containing *c* pronounced *s* is of Anglo-Saxon origin, except a few misspelled, as *cinder* for *sinder*, and *once, twice*, etc., *pence, mice*, etc., having *-ce* for original *-es, -s*. (See *-ce*1.) For the sounds of *ch*, see *ch*.

2. As a numeral, in the Roman system, C stands for 100, and is repeated up to CCCC, 400 (followed by D, 500). This symbol, originally ⊙, that is, the Greek theta (Θ), was afterward reduced to C and understood to stand for *centum*, a hundred.

3. As a symbol: (*a*) In *music:* (1) Used in English and German to designate the key-note of the natural scale. See *natural* and *scale*. (2) When placed on the staff immediately after the clef, a sign of common time, each measure containing 4 quarter notes or their equivalent. When a vertical line is drawn through it, it indicates alla breve time, each measure containing 2 or 4 half notes, played more quickly than in common time. (3) On the keyboard of the organ or pianoforte, the white key or digital next to the left of each group of two black keys. The *middle C* of the keyboard is a usual starting-point in the reckoning of both keys, tones, and notes; it is also known as *alto C*, or *c′;* the next C below is called *tenor C*, or *c;* the second C below, *base c*, or *C;* and the next C above, *treble C*, or *c″*, etc. The present pitch of *middle C* is from 250 to 265 vibrations per second; it is often theoretically fixed in Germany at 264, in England at 256, and in France at 251. About 1700 it was actually about 240, and in recent times as high as 275. The major scale of C, because it comprises all the white keys and none of the black ones, is taken as the normal or standard scale of the keyboard. (*b*) In the mnemonic names of moods of syllogism, the symbol of reduction *per impossibile*. (*c*) In *math.*, C is used to denote a constant of integration. See also *A*, 2 (*c*), (*d*), (*e*). (*d*) In *chem.*, the symbol for *carbon*.

4. As an abbreviation, *c.* or *C.* stands, in dental formulas of zoölogy (*c.*), for *canine tooth;* in United States money (*c.*), for *cent;* in thermometer-readings (*C.*), for *centigrade;* in French money (*c.*), for *centime;* in references (*c.*), for *chapter* (or Latin *capitulum*); in dates, before the number (*c.*), for Latin *circa*, about; in meteorology (*c.*), for *cirrus;* in a ship's log-book (*c.*), for *cloudy;* and in measures of volume (*c.*), for *cubic*.—**Middle C**, in *music*, the note on the first leger-line above the bass or below the treble staff. It was equal to 2.021 liters, or 4¼ United States pints. Other statements appear to be due to confusion of different measures by Greek metrologists; but a *great cab*, of ⅝ of the ordinary size, is mentioned in the Talmud.

> These ministers were therefore emphatically called the *Cabal;* and . . . it has never since their time been used except as a term of reproach. *Macaulay*, Hist. Eng., ii.

=**Syn. 4.** *Combination, Party, Faction, Cabal, Camarilla, Junto. Combination* is the most general of these words, but it expresses least of permanence in organization; it often denotes the union for special ends of individuals or parties otherwise antagonistic: as, the Democrats and Greenbackers entered into a *combination* to secure the election. A *party* is strictly a more close and permanent union of individuals, organized to promote certain principles or common interests which they consider of fundamental importance: as, the Low Church *party*, the Republican *party;* but the term is more loosely used where organization is wanting: as, the Free-trade *party*. *Combination* and *party* may express that which is entirely reputable; the other words are chiefly unfavorable in their signification. A *faction* is commonly a section of a party; it is generally a comparatively small number of individuals, whose principles and objects are often of a captious, frivolous, or selfish nature, but advocated so persistently as to be annoying, and with so little regard to the general interest as sometimes to be dangerous. *Cabal* and *junto* express a union less comprehensive than *party* or even *faction;* the intrigues of a *cabal* or *junto* are usually conducted mainly for the personal aggrandizement of its members. *Junto* has almost entirely given place to *cabal* in modern use. A *camarilla* is a more or less united body of secret counselors of a ruler, acting generally in opposition to his official advisers, and constituting a "power behind the throne."

After numerous abortive attempts and unsuccessful *combinations* in which Newcastle bore the chief part, it became evident . . . that the union . . . of Newcastle . . . and Pitt was absolutely necessary. *Lecky*, Eng. in 18th Cent., viii.

By a *faction*, I understand a number of citizens, whether amounting to a majority or minority of the whole, who are united and actuated by some common impulse of passion, or of interest, adverse to the rights of other citizens, or to the permanent and aggregate interests of the community. *Madison*, Federalist, No. 10.

Hence *cabal*[1].] **1.** The theosophy or mystic philosophy of the Hebrew religion, which grew up mainly after the beginning of the tenth century, and flourished for many generations. The cabala employed itself first in a mystic explanation of Deity and cosmogony, and in the creation of hidden meanings for the sacred Hebrew writings, thus drawing into its province all the Hebrew law and philosophy. Later cabalists pretended to find wonderful meanings even in the

letters and forms of the sacred texts, and made for themselves elaborate rules of interpretation.

The cardinal doctrines of the cabalists embrace the nature of the Supreme Being, the Divine emanations or Sephiroth, the cosmogony, the creation of man, psychology, the destiny of man and the universe, and the import of the revealed law. The cabalists seem to have endeavored to identify all such sciences as demonology, astrology, chiromancy, sympathetic medicine, etc., with their theosophic mysticism, weaving the whole into a secret universal wisdom or esoteric philosophy of the universe. They sympathized with many points of Christianity, so that in the fifteenth and sixteenth centuries the cabala was by many thought highly important as a proof of Christianity and as a means of converting the Jews.

In Great Britain, though the executive government is vested nominally in the crown, it is practically in a committee of ministers called *the cabinet*, which is of comparatively modern development. Every cabinet includes the First Lord of the Treasury, who is generally chief of the ministry, or prime minister, the Lord High Chancellor, the Lord President of the Council, the Chancellor of the Exchequer, the First Lord of the Admiralty, and the five Secretaries of State, with two or more other members, at the prime minister's discretion. In the United States *the cabinet* is a collective popular name, not recognized by law, for the heads of the ten executive departments, namely, the Secretaries of State, the Treasury, War, the Navy, the Interior, Commerce, Labor, and Agriculture, the Postmaster-General, and the Attorney-General. They are appointed by the President, by and with the advice and consent of the Senate, and are removable at the President's pleasure. They have as a body no legal functions, but by custom meet the President at stated times for consultation. The term *cabinet* is also sometimes applied to the executive council of a governor or of a mayor.

It is to the antagonism between the court and the administration, between the curia and the camera, or in modern language the court and the *cabinet*, that many of the constitutional quarrels of the century are owing.
Stubbs, Const. Hist., § 247.

The insulating layers are generally separated from the outer wires by a padding of jute or hemp saturated with tar or other protective substance. Cocoa consists of the nibs alone, either unground or ground, dried, and powdered, or of the crude paste dried in flakes. Broma is the powder of the beans after expression of the oil; commonly mixed with arrowroot or other starch. A decoction is also made from the husks (cocoa-shells). These substances, containing the alkaloid theobromine, analogous to thein and caffein, are very extensively used as substitutes for tea and coffee. of the tonic. These two forms of the perfect cadence were in ancient church modes called *authentic*, in distinction from the *plagal* cadence. An example of each form in C major is here given. The end of a piece should properly be a complete cadence, incomplete and interrupted cadences being suitable only as temporary endings for phrases or periods in the midst of a piece.—**Imperfect cadence**, the chord of the tonic followed by that of the dominant; it rarely occurs as a final close.—**Interrupted or deceptive cadence**, a cadence formed by a chord foreign to that which was expected, thus evading the close and deceiving expectation. Thus, in the example, the second chord has A in the bass instead of C, which is naturally expected. Also called *suspended cadence*.—**Medial cadence**, a cadence in ancient church music in which the mediant was the most important note.—**Mixed cadence**, a cadence in which a subdominant is followed by a dominant, and this by a tonic chord: so called from its being a combination of the authentic and plagal cadences of ancient church music.—**Plagal cadence**, a cadence which con-

sists of the chord of the subdominant followed by that of the tonic: frequently used at the close of chants or hymn-tunes with the word "amen," and sometimes popularly called the *amen cadence*.—**Suspended cadence**, an interrupted cadence.

cadence (kā'dens), *v. t.*; pret. and pp. *cadenced*, ppr. *cadencing*. [< *cadence*, *n.*] To regulate by musical measure: as, well-*cadenced* music.

cadency (kā'den-si), *n.* [Extended form of *cadence*: see *-ency*.] 1. Regularity of movement; rhythmical accord.

But there is also the quick and poignant brevity of it [repartee] to mingle with it; and this, joined with the *cadency* and sweetness of the rhyme, leaves nothing in the soul of the hearer to desire.
Dryden, Essay on Dram. Poesy.

2. In *her.*, the relative status of younger sons. Also *brisure*.—**Marks of cadency**, in *her.*, bearings used to distinguish the shields of the second son, the third son, etc. This is sometimes effected by a bearing differing only in details on the shields of the different sons, as a label having three, four, or more points, to mark their respective order. It is also effected by means of a totally different bearing. Thus, in modern times it has been ordained that the eldest son should wear a label during the lifetime of his father, or until he inherits the paternal shield, without marks of cadency; the second son a crescent, the third a mullet, the fourth a martlet, the fifth an annulet, the sixth a fleur-de-lys, the seventh a rose, the eighth a cross moline, the ninth a double quatrefoil. The mark of cadency may become a permanent part of the shield if the younger son acquires estates of his own and builds up a family of consequence; thus the bordure, which is originally a mark of cadency, has often become a permanent bearing, and the shield which contains it bears new marks of cadency when borne by the sons of its possessor.

cadene (ka-dēn'), *n.* [< F. *cadène*, < Pr. *cadena*, a chain, = Sp. *cadena*, a chain, the warp in weaving, < L. *catena*, a chain: see *catena* and *chain*.] A common kind of carpet imported from the Levant. *E. H. Knight.*

cadent (kā'dent), *a.* [< L. *caden(t-)s*, ppr. of *cadĕre* (in late popular L. *cadĕre*, > It. *cadere* = Sp. *caer* = Pg. *cair* = Pr. *cazer* = OF. *cheoir*, mod. F. *choir*), fall, = Skt. √ *çad*, fall. Hence, from L. *cadere*, ult. E. *cadence, chance, case*[1], *casual, cadaver, accident, incident, occident*, etc., *decay, decadence*, etc.] **1.** Falling; sinking. [Rare.]

2. In *astrol.*, falling from an angle: applied to the third, sixth, ninth, and twelfth houses, which follow the meridian and the horizon.— **3.** Specifically applied to the tenth of Professor Rogers's fifteen divisions of the Paleozoic strata of Pennsylvania, which suggest metaphorically the different natural periods of the day. It corresponds to the Marcellus, Hamilton, and Genesee divisions of the New York survey.

cadenza (ka-den'zä), *n.* [It.: see *cadence.*] In *music*, a more or less elaborate flourish or showy passage introduced, often extemporaneously, just before the end of an extended aria or concerto, or as a connective between an intermediate and a final division. It is always intended to display the technical proficiency of the performer, and to arouse wonder and applause, and hence, except in the hands of a master, is often deficient in intellectual or expressive character, as well as incongruous with the remainder of the piece. Modern composers, therefore, usually write out cadenzas in full, instead of trusting, as was customary in the seventeenth and eighteenth centuries, to the taste and readiness of singers and players. Also called *cadence.*

cade-oil (kād'oil), *n.* [After F. *huile de cade* (ML. *oleum de cada*, oil of juniper; G. *kaddigöl*): *huile*, oil (see *oil*); *de* (< L. *de*), of; *cade* (= Pr. *cade* = Sp. *cada* = ML. *cada*), juniper, prob., like G. *kaddig, kaddik*, < Bohem. *kadik*, juniper.] An oil strong with empyreumatic principles, extracted from juniper-wood by distillation, and used in France and Germany, in veterinary practice and in human therapeutics, for eczema and other skin-affections. cadet[1] (ka-det'), *n.* [In 17th century *cadee*, later Sc. *cadee*, a younger son (and in extended sense *cadie, caddie*, etc.: see *caddie* and *cad*), < F. *cadet*, a younger son, < OF. dial. *capdet*, < ML. *capitellum*, a little head, dim. of L. *caput* (*capit-*), head. The cadet was the 'little head' of his own branch of the family, in distinction from the eldest son, the 'head' of the whole family. The former practice of providing for the younger sons of the French nobility by making them officers of the army gave rise to the military use of the word.] **1.** The younger or youngest son.

Specifically— (*a*) One who is under training for a commission in the army or navy by a course of instruction and military discipline in the United States Military Academy at West Point, or the United States Naval Academy at Annapolis. Cadets are nominated for admission, after examination, by the President, a United States senator, or a member of Congress. By an act of Congress, approved July 1, 1902, the title 'naval cadet,' was changed to 'midshipman.' (*b*) One who is undergoing a similar course of instruction and discipline in the Royal Military Academy at Woolwich or the Royal Military College at Sandhurst in England or in one of the numerous cadet-schools of Germany, etc.

cadmium (kad'mi-um), *n.* [NL., < L. *cadmia:* see *cadmia.*] Atomic weight, 112.40; chemical symbol, Cd. A metal discovered by Stromeyer in 1818, resembling tin in color and general appearance, and, like that metal, having a "cry" when bent. The specific gravity of the cast metal is 8.55; of the rolled, 8.67. Its hardness is between that of gold and tin, and it is easily rolled to sheets or even to very thin foil. It fuses at about the same temperature as lead, 609° F., and communicates to various alloys the property of fusing at very low temperatures. (See *Wood's metal*, under *metal.*) If 8 to 10 per cent. of cadmium be added to Rose's metal, its fusing-point is lowered to 167°. Cadmium is a common accompaniment of zinc ores, both blende and calamin, and it is in the smelting of these that the commercial metal is obtained, which is done almost exclusively in Silesia and Belgium. Some kinds of blende contain as much as 3 or 4 per cent. of sulphid of cadmium. This metal also occurs by itself naturally in combination with sulphur, forming the rare mineral called greenockite (which see). The manufactured sulphuret is of importance as furnishing a brilliant and permanent yellow color called cadmium-yellow (see below). This is used by artists, also in coloring soap, and to some extent in calico-printing; it is also used for giving a yellow luster to the surface of porcelain. The total produce of cadmium is about fifteen tons a year.— **Cadmium blende,** the mineral greenockite.

It was originally merely the Greek herald's staff, a plain rod entwined with fillets of wool. Later the fillets were changed to serpents; and in the conventional representations familiar at the present day the caduceus is often winged. The caduceus is a symbol of peace and prosperity, and in modern times figures as a symbol of commerce, Mercury being the god of commerce. The rod represents power; the serpents represent wisdom; and the two wings, diligence and activity. In heraldry it is blazoned as a staff having two serpents annodated about it, mutually respectant, and joined at the tails; it is a rare bearing.

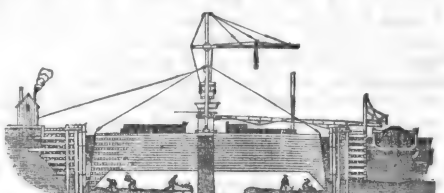
In birds there are usually two cæca; sometimes one cæcum, attaining great size in some cases, as of the herbivorous geese; sometimes none. There being no obvious distinction between the ileum and the colon in birds, the site of the cæca or cæcum is taken as the beginning of the colon. In fishes cæca are often numerous and large. (*b*) An apparatus on which vessels may be raised and floated; especially, a kind of floating dock, which may be sunk and floated under a vessel's keel, used for docking vessels at their moorings, without removing stores or masts. (See *floating dock*, under *dock.*) (*c*) A water-tight box or casing used in founding and building structures in water too deep for a coffer-dam, such as piers of bridges, quays, etc. The caisson is built upon land, and then chained and anchored directly over the bed, which has been leveled or piled to receive it. The masonry is built upon the bottom of the caisson, which is of heavy timber. As the caisson sinks with the weight, its sides are built up, so that the upper edge is always above water. In some cases the masonry is at first built hollow, and is not filled in until after it has reached its bed, and its sides have been carried higher than the surface of the water. Sometimes the sides of the masonry itself form the sides of the caisson. In another form the caisson, made of heavy timbers, is shaped like an inverted shallow box, having sharp, iron-bound edges. The weight of the masonry forces the caisson into the sand and mud on the bottom. Air under pressure is then forced into the caisson,



Caisson of the Brooklyn Bridge, New York.

driving out the water and permitting the workmen to enter through suitable air-locks. A sealed well or a pipe and sand-pump are provided, through which the material excavated under the caisson may be removed. The latter gradually sinks under the weight of the superstructure and the removal of the loose soil below, until a firm foundation is reached, when the whole interior of it is filled with concrete. The caissons beneath the towers of the Brooklyn suspension-bridge, connecting New York and Brooklyn, are of this description. The *pneumatic caisson* is an inverted air-tight box, into which air is forced under a pressure sufficient to expel the water, thus leaving a space in which men can work to loosen the soil as the caisson descends. The principle of the pneumatic caisson is applied to the sinking of large iron cylinders to serve as piers or land-shafts. Sometimes written *caissoon.*

They are usually if not always hermaphrodite, producing both ova and spermatozoa from modified cells of the endoderm; impregnation and early embryonic stages of development are carried on while the ova remain in the body of the parent. In a wider sense, the *Calcispongiæ* include the physemarians as well as the olynthians, and are primarily divided into the two orders *Physemaria* and *Olynthoidea*. calcite (kal'sīt), *n.* [< L. *calx* (*calc-*), lime, + *-ite*[2].] Native calcium carbonate, or carbonate of lime, one of the commonest of minerals. It occurs in a great variety of crystalline forms, rhombohedrons, scalenohedrons, etc.; the fundamental form being a rhombohedron with a terminal angle of 105°, parallel to which the crystallized mineral has highly perfect cleavage, so that a mass of it breaks up with a blow into a great number of small rhombohedrons. The transparent colorless variety is called *Iceland spar* or *doubly refracting spar*, and is used for the prisms of polariscopes. *Dog-tooth spar* is a variety in acute scalenohedral crystals. Satin-spar is a fibrous, and argentine a pearly lamellar variety; the granular, compact, or cryptocrystalline varieties constitute marble, limestone, chalk, etc. Stalactites and stalagmites are forms deposited in limestone caves; calc-sinter, calc-tuff, or travertin is a porous deposit from springs or rivers which in flowing through limestone rocks have become charged with calcium carbonate. Agaric mineral, or rock-milk, is a soft white variety easily crumbled in the fingers; it is sometimes deposited in caverns. (See cut under *spar.*)

★**calcium** (kal'si-um), *n.* [NL., < L. *calx* (*calc-*), lime: see *calx*[1] and *chalk.*] **1.** Chemical symbol, Ca; atomic weight, 40.09. A metal having a light-yellow color and brilliant luster, about as hard as gold, very ductile, and having a specific gravity of about 1.57. It oxidizes readily in moist air, and at a red heat burns vividly, forming calcium oxid, CaO, or quicklime, one of the alkaline earths. On adding water this forms calcium hydroxid, $Ca(OH)_2$, or slaked lime. Calcium is not found native in the metallic state, but it unites with most of the non-metallic elements in compounds which are widely distributed in nature and extensively used. The mineral calcite, all limestone or marble, and the chalk deposits are calcium carbonate; gypsum is calcium sulphate; and calcium also enters into the composition of many of the natural silicates.

2. A calcium light. [Colloq.]—**Calcium carbide**, CaC_2. It is used in making acetylene gas.—**Calcium light**, a very intense white light produced by turning two streams of gas, one of oxygen and the other of hydrogen, in a state of ignition, upon a ball of lime. Captain Drummond, the inventor, proposed the use of this light in lighthouses. Another light, previously invented by him (1825), was employed in geodetical surveys when it was required to observe the angles subtended between distant stations at night. The light was produced by placing a ball or dish of lime in the focus of a parabolic mirror at the station to be rendered visible, and directing upon it, through a flame arising from alcohol, a stream of oxygen gas. Also called *Drummond light, oxycalcium light, limeball-light*, and *lime-light.*

[Colloq., New Eng.]—**Syn. 1** and **2.** *Calculate, Compute, Reckon, Count.* *Calculate* applies to the most elaborate and varied mathematical processes: as, to *calculate* an eclipse or a nativity. *Compute* is more applicable to the simpler processes: as, to *compute* the interest on a note. But mathematicians make the opposite distinction; in their language, *to compute* means to make elaborate calculations with the art of a person trained to this business. *Reckon* is essentially the same as *compute*, but may be simpler yet: as, to *reckon* interest, or the amount of a bill, or the days to a coming event. To *count* is to reckon one by one. The figurative uses of these words are not suggested by any comparison of their literal meanings; in them all some mental estimate may be supposed to be made, akin to an arithmetical process. "I *reckon* that the sufferings of this present time are not worthy to be compared with the glory which shall be revealed in us." Rom. viii. 18. The use of *calculate* for *reckon* in such a case as this is an Americanism. "I *count* not myself to have apprehended." Phil. iii. 13. *Reckon* may be used in such a connection, but not the other two words.

When they come to model heaven
And *calculate* the stars. *Milton*, P. L., viii. 80.

calculating-machine (kal'kū-lā-ting-ma-shēn″), *n.* Any machine which performs numerical calculations. The principal kinds are: (*a*) Multiplying and dividing machines. (*b*) Difference-engines, which calculate and print tables from the initial values of the tabular number and its first, second, etc., differences. The first of these was that of Babbage, of which the Scheutz machine, now at the Albany observatory, is a modification. (*c*) The analytical engine of Babbage, which was designed to calculate and print tables of a function from constants, but was never actually constructed. (*d*) Tide-predicting machines, of which several have been constructed, with one of which, that of Ferrel, the regular tide-tables published by the United States Coast Survey are now computed. (*e*) Machines for integrating differential equations, though these are rather instruments than machines. (*f*) Logical machines, for deducing conclusions from premises. There are also important instruments for performing calculations, which are not usually called machines. Such are the abacus, the celestial globe, and Hill's machine for predicting eclipses and occultations, used in the calculation of the American ephemeris. (See cut under *abacus.*) There are also various calculating-scales, such as Napier's bones. Many of these devices are of considerable utility, such as Airy's stick for gaging cylindrical vessels, and the gagers' rod. Some instruments perform calculations subsidiary to the process of measurement, as the *planimeter.*

There are also gouty concretions called *arthritic calculi*, and others called *pancreatic calculi*, *lacrymal calculi*, *spermatic calculi*, etc.

3. In *math.*, any highly systematic method of treating a large variety of problems by the use of some peculiar system of algebraic notation. By *the calculus*, without qualification, is generally understood the *differential calculus*, invented by Leibnitz (although Newton's method of fluxions comes virtually to the same thing). In this method quantities are conceived as varying continuously, and when equations exist involving several quantities, these quantities will, in consequence of these equations, vary together, so that there will be equations between their rates of change, the differential or infinitely small increment of a variable being denoted by the letter *d* written before the symbol denoting the variable. The differential calculus treats of the values of ratios of these differentials, and of the fundamental formulas into which these ratios enter. The *integral calculus* treats of integration, or the summation of an infinite series of differentials; it is largely an inverted statement of a part of the doctrine of the differential calculus, but it also introduces imaginary quantities and leads up to the theory of functions.—**Barycentric calculus.** See *barycentric.*—**Calculus of enlargement,** a method of obtaining algebraical developments, etc., by the use of E (see *calculus of finite differences*) and other symbols of operation.—**Calculus of equivalent statements.** Same as *calculus of logic.*—**Calculus of finite differences,** a method of calculating, mainly by means of the symbols E, Δ, and Σ: the first, E, signifying the operation of increasing the independent variable of a function by unity; the second, Δ, the increase in the value of a function produced by increasing its variable by unity; and the third, Σ, the operation of adding all values of the function for integral values of the variable from unity up. The calculus of finite differences differs from the differential calculus, not merely in considering finite differences instead of differentials, but also in not assuming continuity.—**Calculus of forms,** the theory of invariants, etc., treated symbolically after the manner of Gordan.—**Calculus of functions,** a branch of the calculus of finite differences; a method of finding functions which fulfil given conditions.—**Calculus of logic,** a method of working out conclusions from given premises by means of an algebraic notation.—**Calculus of operations,** the general method of treating mathematical problems by operating algebraically upon symbols of operation.—**Calculus of probability.** See *probability.*—**Calculus of quaternions,** the method of calculating by means of quaternions.—**Calculus of variations,** a branch of the differential calculus, using δ, the sign of the variation of a function, for the solution of problems of maxima and minima.—**Fluxional** or **fluxionary calculus.** See *method of fluxions*, under *fluxion.*—**Fusible calculus,** a variety of urinary concretion consisting of mixed ammonium-magnesium and calcium phosphates. It is so named because it fuses before the blowpipe.—**Imaginary calculus,** the method of calculating by the use of an imaginary unit, the square of which is supposed to be −1, and which is added and multiplied like a number.—**Mulberry calculus,** a urinary concretion consisting chiefly of oxalate of lime. Many of these calculi in form and color somewhat resemble the fruit of the mulberry.—**Residual calculus,** a method of calculating by the operation called *residuation* (which see); a branch of the integral calculus invented by Cauchy.

caldera (kal-dā′rä), *n.* [Sp., a kettle: see *caldron.*] A large kettle or caldron; hence, in *geol.*, an amphitheatrical depression in a volcanic cone. The term was originally used in describing volcanic regions occurring where Spanish is the current language, and was introduced by Von Buch in his classic description of the Canaries. Its use has been extended thence to other countries, and by it is understood a large amphitheatrical or kettle-like depression occurring in volcanic rocks, surrounded by high and steep walls, which are usually more or less broken away on one side or cut through by deep ravines (*barrancas*). Calderas are generally admitted to be volcanic craters enlarged by the action of subterranean disruptive forces. *Crater* is more appropriately applied to the cavity at the top of a volcanic cone around which the ejected materials have been heaped up in the process of eruption: *caldera* is the much larger cavity that is formed by later destructive volcanic action, when much of the upper part of the cone is blown off or engulfed. The finest caldera in the United States is in Oregon, and is occupied by Crater Lake. The modern cone of Vesuvius, with a crater in its top, has been built eccentrically over an ancient caldera whose eastern rim is Monte Somma.

For each month the zodiacal sign is represented, with one or more persons engaged in labors or sports characteristic of the month. —**Calendar - amendment Act**, an English statute of 1751, which took effect in 1752, establishing January 1st as the beginning of each year (instead of Lady-day, March 25th), adopting the Gregorian or "new style" in place of the Julian or "old style" calendar, and canceling the then existing excess of 11 days by making the 3d of September, 1752, the 14th. Also known as *Lord Chesterfield's Act.* —**Calendar month**, a solar month as it stands in almanacs.—**Calendar moon.** Same as *ecclesiastical moon* (which see, under *ecclesiastical*).—**Ecclesiastical calendar**, an arrangement of the civil year employed by the liturgical churches to designate the days set apart for particular religious celebration. As many feasts of the church depend upon Easter, the date of which varies from year to year, either the calendar must vary every year or must contain simply the matter from which a true calendar can be computed for each year. In the Roman Catholic Church, special circumstances in the history of each nation affect its liturgical calendar; hence every nation, and to some extent every religious order and even every ecclesiastical province, has its own calendar. The German Lutheran Church retained at the Reformation the Roman Catholic calendar, with the saints' days then observed. The Church of England still retains in its calendar certain festivals, called black-letter days, for which no service is prescribed, and which have been omitted by the Protestant Episcopal Church of America. See *Easter.*—**Gregorian calendar**, the reformed Julian calendar introduced by the bull of Pope Gregory XIII. in February, 1582, and adopted in England in September, 1752; the "new style" of distributing and naming time. The length of the year of the Gregorian calendar is regulated by the Gregorian rule of intercalation, which is that every year whose number in the common reckoning since Christ is not divisible by 4, as well as every year whose number is divisible by 100 but not by 400, shall have 365 days, and that all other years, namely, those whose numbers are divisible by 400, and those divisible by 4 and not by 100, shall have 366 days. The Gregorian year, or the mean length of the years of the Gregorian calendar, is 365 days, 5 hours, 49 minutes, and 12 seconds, and is too long by 26 seconds. The Gregorian rule has sometimes been stated as if the year 4000 and its multiples were to be common years: this, however, is not the rule enunciated by Gregory. The Gregorian calendar also regulates the time of Easter, upon which that of the other movable feasts of the church depend; and this it does by establishing a fictitious moon, which is purposely made to depart from the place of the true moon in order to prevent the coincidence of the Christian Paschal feast with that of the Jews.—**Hebrew calendar**, the luni-solar calendar used by the Jews since the second century of the Christian era. The years, numbered from the creation, are either ordinary, containing 12 lunar months and 353, 354, or 355 days, or embolismic, containing 13 lunar months and 383, 384, or 385 days. In every cycle of 19 years 7 are embolismic, to bring lunar and solar time into agreement. To find the number of the Hebrew year beginning in the course of a given Gregorian year, add 3761 to the number of the latter.—**Julian calendar**, the solar calendar as adjusted by Julius Cæsar, in which the chronological reckoning was first made definite and invariable, and the average length of the year fixed at 365¼ days. This average year (called the *Julian year*) being too long by a few minutes, the error was rectified in the Gregorian calendar. The Julian calendar, or "old style," is still retained in Russia and Greece, whose dates consequently are now 13 days in arrear of those of other Christian countries.—**Mohammedan calendar**, the lunar calendar employed in all Mohammedan countries, though there is another peculiar to Persia. The years consist of 354 or 355 days, in the mean 354$\frac{11}{30}$. The beginning of the year thus retrogrades through different seasons, completing their circuit in about 33 years. They are numbered from the hejira (which see), the first day of the first year being July 16th, A. D. 622. The 1300th year began Sunday, November 12th, 1882.—**Republican calendar**, the calendar of the first French republic. The year consisted of 365 days, to which a 366th was to be added "according as the position of the equinox requires it," so that the year should always begin at the midnight of the Paris observatory preceding the true autumnal equinox. The numbers of the years were written in Roman numerals. The year I. began September 22d, 1792, but the calendar was not introduced until October 5th, 1793. Every period of four years was called a *franciade*. The years of 366 days were called *sextile*. There were 12 months of 30 days each, and 5 or 6 extra days at the end called *sansculottides*. The names of the months, beginning at the autumnal equinox, were Vendémiaire, Brumaire, Frimaire, Nivose, Pluviose, Ventose, Germinal, Floréal, Prairial, Messidor, Thermidor, and Fructidor.

The object of the calender for cloth and paper is to give the material a perfectly smooth and equal surface, and sometimes to produce a superficial glaze, as in certain cotton and linen fabrics and what is specifically called *calendered paper*, or a wavy sheen, as in watered silk, etc. The larger rolls in such a calender are usually made of solidified paper or pasteboard turned exactly true, with intermediate cast-iron cylinders. Calenders are attached to paper-making machines for expressing the water from the felted web of paper, and for the finishing processes of smoothing and glazing. They are also used for spreading india-rubber into sheets suitable for making rubber fabrics, etc.

The Calenders are wanderers who preach in the market-places and live by alms. Though the title *Calender* asserts for its bearers a life of great purity, the members of this order, even before the death of its founder, fell into the grossest licentiousness and debauchery, and have not hesitated at assassination. They hold that salvation is as little affected by vice and crime as by virtue and holiness, and that sin stains the body only and can be removed by ablutions.

The reason of the name is uncertain.] **1.** In the Roman calendar, the first day of the month. From this the days of the preceding month were counted backward to the ides, which in March, May, July, and October corresponded to the 15th, and in all the other months to the 13th day of the month. Thus the 16th day of March by our reckoning was in the Roman calendar the 17th day before the calends of April (the first of April being included), or more briefly 17th calends; the 14th day of January was the 19th day before the calends of February; the 14th day of any month with thirty days being the 18th before the calends of the succeeding month.

The patterns are engraved upon the surface of copper rollers, and the movement of the cloth is continuous and rapid. The colors used are either substantive or adjective: the former have an affinity for the cloth, and by themselves adhere and form permanent dyes; the latter will not of themselves adhere to the fibers, or, if they do, are not permanent, but require to be fixed by mordants. The various styles of printing are called the *bandana, china-blue, decoloring, discharge, madder, padding, resist* style, etc.

Calling of the plaintiff, a form in English courts of law of calling upon the plaintiff to appear in cases where, for want of sufficient evidence, he consents to be nonsuited or to withdraw himself. Calling the plaintiff by the court crier was once always necessary in a trial after the jury had come in with the verdict, and before its announcement. If no answer was made, the plaintiff was nonsuited, but could renew his action on better evidence. —**Effectual calling**, in *Calvinistic theol.*, the calling by God's word and Spirit of those whom he has predestined unto life, out of sin and death, unto grace and salvation by Jesus Christ. =Syn. 2. *Calm, Placid, Tranquil, Serene, Quiet, Cool, Composed, Collected*, smooth, peaceful, unruffled, imperturbable. All the italicized words, when applied to the mind, still suggest the physical phenomena which they primarily denote. *Calm* implies that the mind remains unagitated, even by care and anxiety. There is a tendency to use the word to express the most complete mastery of the emotions; but it is also used for the mere outward manner: as, in spite of his anger, he remained *calm*. *Placid* is by derivation associated with the notion of pleasure; it generally applies to that which belongs to the nature, but is also especially used of the face: as, a *placid* smile. *Tranquil* implies not so much a mastery of self amid disturbing circumstances as freedom from that which agitates, a settled calm. *Serene*, by its association with the aspects of the sky, implies an exalted calm, a tranquillity that rises above clouds or storms. *Quiet*, when applied to the disposition, implies that the person is naturally silent and undemonstrative; externally it implies that one is free from annoyances: as, to leave him in *quiet*. Like *tranquil*, but unlike the rest, it is not suggestive of a triumph of self-control over natural agitation of feelings or confusion of mind. *Cool* is the opposite of *heated;* it indicates that state in which the heat of feeling is perfectly kept down, so that the intellectual faculties are not hindered from their best operation. *Composed* is applicable to the state of both thoughts and feelings, while *collected*, gathered together, can be used only with reference to the thoughts. *Composed* differs from *collected* also in expressing, like *calm*, merely a frame of mind; while *collected*, like *cool*, expresses a readiness for action with the full and unimpeded force of the mind. See *apathy*.

Calm me, my God, and keep me *calm*, . . .

In the ice-calorimeter the substance to be operated on is inclosed in a cavity of ice, and the quantity of heat is determined by observing the increase of volume due to the melting of a portion of the ice. In other forms the rise in temperature of a known quantity of some liquid, as water or mercury, or the amount of expansion caused in a known volume of mercury, is noted.

calorimetric, calorimetrical (kal″ō-ri-met′rik, -ri-kal), *a.* Of or belonging to the calorimeter or to calorimetry.

Hare's deflagrator was an early form.

calory (kal′ō-ri), *n.* [< F. *calorie*, < L. *calor*, heat.] In *phys.*, the quantity of heat necessary to raise the temperature of a kilogram of water from 0° to 1° centigrade. It is the unit of heat ordinarily employed in calorimetry by modern physicists, instead of the thermal unit based on the English measures. (See *thermal*.) The small calory or thermal unit on the C. G. S. system is the heat required to raise the temperature of one gram of water from 0° to 1° C. Although this particular degree of the scale is always specified in formal definitions, yet it is practically assumed that the specific heat of water is constant; so that if the calory were defined in terms of the degree from 20° to 21°, it would more accurately represent the meaning in use. Also spelled *calorie*. The small calory at 20° C., according to the generally accepted value of Rowland, is 4.181 joules or 4.181×10^7 ergs.

It contains both winged sexual individuals and apterous, fully developed, but sexually aborted individuals. *C. flavicollis* of southern Europe is an example.

The nests of species of *Calotermes* are the most incomplete; they only gnaw passages in wood, which mainly run in the direction of the axis of the tree. There is no special place for the queen. *Claus*, Zoöl. (trans.), p. 560.

It is employed in many diseases, especially in dysentery, as an alterative tonic and diaphoretic, and as a substitute for ipecac. *C. procera* occurs in the tropics of both hemispheres, and *C. gigantea* from India to Borneo and China. The silky fiber of the latter is finer in quality, and is used for the robes of the native princes, for bowstrings, and for fishing-lines and -nets, as it is almost indestructible in water. The wood of both species is made into charcoal for gunpowder, the acrid milky juice mixed with salt is used to remove hair from hides, and the hairs of the seeds are employed for stuffing mattresses.

'bald,' < *calvus*, bald: see *callow*[1].] The theological tenets or doctrines of John Calvin, a French Protestant theologian (1509–64). The peculiar characteristics of his system, as derived from

his "Institutes," are his doctrines of original sin, namely, that we derive from Adam "not only the punishment, but also the pollution to which the punishment is justly due"; of freedom of the will, namely, that man "in his present state is despoiled of freedom of will and subject to a miserable slavery"; of grace, or that "the Lord both begins and completes the good work in us," and gives us "both will and power"; of predestination, or "the eternal decree of God, by which he has determined in himself what he would have become of every individual of mankind"; and of perseverance, or the doctrine that all the elect will certainly be saved. Calvinism has, however, been materially modified since Calvin's day, and the name is applied to modern systems of theology which differ more or less widely from his system in each of these particulars. (See *Calvinist.*) Generally, Calvinism may be said to rest upon the absolute sovereignty of God over all his creatures. It is in a modified form the theological system of most Baptists, Presbyterians, and Congregationalists.

If Arminianism most commends itself to our feelings, *Calvinism* is nearer to the facts, however harsh and forbidding these facts may seem.

Froude, Short Studies on Great Subjects, II. 12.

American Congregationalists and the so-called New School Presbyterians are generally moderate Calvinists.

first to fall. It may form the entire perianth, no corolla being present; or when there are several whorls of envelops, they may so grade into each other that the calyx cannot be strictly separated from the bracts without and the petals within. The parts of a calyx when distinct are called sepals, and it is disepalous, trisepalous, etc., according to their number. The base of the calyx is the summit of the stem, which may be a modified joint or ossicle composed of confluent joints. See cut under *Crinoidea*. cam[1] (kam), *n.* [A dial. form of *comb*[1], < ME. *camb*, < AS. *camb* = D. *kam* = G. *kamm* = Dan. Sw. *kam*, etc., a comb; also applied to several mechanical devices, as D. *kam*, a bridge, sley, = G. *kamm*, a cog (*kamm-rad*, a cog-wheel), = Dan. *kam*, a cog, bit, ridge (*kam-hjul*, a cog-wheel): see *comb*[1].] 1. A comb. [Prov. Eng.]—2. A ridge, hedge, or long earthen mound. [North. Eng.]—3. In *mach.*, a device for converting a regular rotary motion into an irregular, fast and slow, intermittent rotary or reciprocating motion. It properly includes the cam-wheel, plain or geared, the cam-shaft, the heart-wheel, the wiper, the wiper-wheel, and the eccentric. The simplest form is that of a heart-shaped, lobe-shaped, or otherwise eccentric wheel, which imparts motion to another wheel either by means of gearing or by rolling contact. Instead of following the irregular face of the cam-wheel, the friction-wheel may travel in a curved race or guiding path on the side of a cam-disk, as in the cam-wheel of a harvester. In another form of cam the face of the wheel is cut into gears or into projecting teeth that may engage another gear, or an arm or a pinion upon a shaft, to give a quickly changing rising and falling motion. Such cams are also called *wiper-wheels*, and are used to operate stamps and tilt-hammers. The heart-wheel accomplishes the same object, but in a less abrupt manner, while eccentric cams of various shapes may impart a slow thrust and quick return, as in many machine-tools. The wiper, a cam-shaped arm, is very generally used to operate the valves of beam-engines. The cam in some of its forms appears in a great variety of machines, wherever an irregular speed or motion or a rapid reciprocating motion is required, as in the harvester, printing-press, sewing-machine, etc. A cam-shaft is a shaft having tumblers or wipers. The heart-wheel is a heart-shaped cam. (See *eccentric.*) Cams for determining motion for cutting and tracing, as in certain machines, are called *shaper-plates.*—**Solid cam,** a form of cam employed when the series of changes in velocity and direction required are too numerous to be included in a single rotation of a cam-plate. The cam is formed on the surface of a cone, either parallel to the axis or spirally, and the cone as it revolves is made to travel also in the direction of its axis by means of a screw.

Cams.
1. Elliptical cam, used for giving motion to the levers of punching- and shearing-machines. 2. ing. (*d*) An imitation of pen-and-ink drawings on colored paper by means of two blocks, one having the design engraved upon it in outline with cross-hatchings, and the other colored in bister, with all the lights taken out, so as to leave the ground of the paper white. It is now known to be not a fluid, but a layer of extremely delicate thin-walled cells, filled with protoplasm and organizable nutrient matter, and appearing like a thin film of mucilage. These cells develop on the one side into a layer of new wood, and on the other of new bark, while at the same time fresh cambium is formed for the continuation of the work. It is by the renewal of this process year after year that the increase of growth in the stem is effected, as indicated by its concentric rings. In the primary fibrovascular bundles of the stem a similar layer of cambium, with the same function, is always found between the woody and cribrose portions.

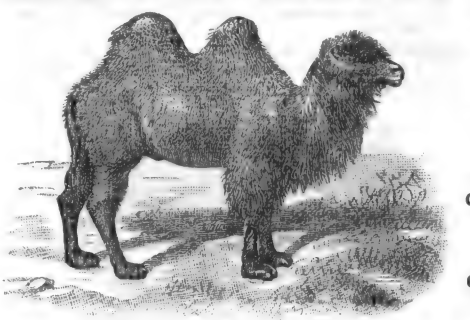
There are two distinct species of camels: (1) The Arabian camel, *C. dromedarius*, with one hump, and four callosities on the fore legs and two on the hind legs. It is a native of Arabia, and is now known only in the domesticated state; it is used chiefly in Arabia and Egypt. There are several breeds or artificial varieties. The dromedary is one of these, being simply a "blooded" or thoroughbred camel of great speed and bottom, used as a saddle-animal, and comparing with the heavier and slower varieties as a race-horse does with a cart-horse; it is not a different animal zoölogically speaking. (2) The Bactrian camel, *C. bactrianus*, with two humps, of which there are also different breeds. The name *camel* is sometimes applied to the species of the American genus *Auchenia*, as the llama, alpaca, and vicuña, collectively known as the camels of the new world. The Arabian camel is poetically called the ship of the desert. Camels constitute the riches of an Arabian; without them he could not subsist, carry on trade, or travel over sandy deserts. Their milk and flesh are used for food and their hides for leather, and their hair is a valuable article of trade and manufacture. By the camel's power of sustaining abstinence from drink for many days, due to the reserve it can carry in its peculiarly constructed cellular stomach, and of subsisting on a few coarse, dry, prickly plants, it is especially fitted for the parched and barren lands of Asia and Africa. Camels carry from 600 to 1,000 pounds burden.



Bactrian Camel (*Camelus bactrianus*).

2. A water-tight structure placed beneath a ship or vessel to raise it in the water, in order to assist its passage over a shoal or bar, or to enable it to be navigated in shallow water. It is first filled with water and sunk alongside the vessel, to which it is then secured. As the water is pumped out, the camel gradually rises, lifting the vessel with it. Camels have also been used for raising sunken vessels.—**Camel's hair**, the hair of the camel, from which very fine fabrics, especially shawls, are made in the East, and also carpets, tent-cloths, etc. In Europe it is used chiefly for mixing with silk. See *brush*.—**Camel's-hair cloth.** (*a*) An Oriental fabric. See *putto*. It is commonly said to have been made of camel's hair, and imported from the East; but as it is repeatedly mentioned as a common and cheap stuff, it is probable that it was an imitation of the Eastern fabric. Cameos on stone are called *stone cameos*, in contradistinction to the *shell cameos*, or those cut on shells which have superposed layers varying in color, such as the *Cassis rufa*, which gives red on sardonyx, the *Cassis madagascariensis*, white on dark claret, the *Cassis cornuta* white on orange, the *Strombus gigas*, white on pink, and other tropical shells. Cameos in distinct bands of colors have been produced since about 150 B. C.; and some of the ancient examples, as the Sainte Chapelle agate, in Paris (13 by 11 inches), representing the apotheosis of Augustus, and the Vienna onyx (9 by 8 inches), representing allegorically the coronation of Augustus, surpass in size and in delicacy of execution the best modern specimens.

It is made usually in the form of a box in two parts, connected by an extensible bellows-like arrangement serving to adjust the focus, and having one or more lenses fixed in the front. Photographic cameras are made in a great variety of shapes and sizes, according to use, as the *pocket-camera*, *copying camera*, *landscape-camera*, and *portrait-camera*; and many different forms of lenses, some of highly specialized types, are used. Provision is made for inserting in the back of the camera carriers or plate-holders containing the dry or wet sensitive plates or the paper films, etc., on which the photographs are taken. See *camera obscura*, below, and *photography*.

4. In *anat.*: (*a*) The so-called fifth ventricle of the brain, between the laminæ of the septum lucidum. (*b*) Some other chambered or vaulted part or organ, as the pericardium (*camera cordis*, chamber of the heart), the cranial cavity (*camera cranii*), etc.—**Camera aquosa** (Latin, humid chamber), the anterior aqueous chamber of the eyeball, bounded in front by the cornea, behind by the iris and crystalline lens.—**Camera lucida** (Latin, clear chamber), an invention of the chemist Wollaston, designed to facilitate the delineation of distant objects. It consists of a solid prismatic piece of glass mounted upon a brass frame. The prism has its angles so arranged that the rays from the object appear reflected as shown below, and is covered at the top by a metallic eyepiece, the hole in which lies half over the edge of the prism, so as to afford a person looking through it a view of the picture reflected through the glass, and a direct view of his pencil or tracing-point. In the figure the object to be traced, *f*, is opposite the perpendicular surface of the prism, *d c*, and the rays proceeding from *f* pass through this surface and fall on the inclined plane *c b*, which makes an angle with *d c* of 67½°; from this they are totally reflected to the plane *b a*, which makes an angle of 135° with *b c*, and are again reflected to the eye at *e* above the horizontal plane, which makes an angle of 67½° with the plane *a b*. The rays of light from the object proceeding upward from *h* toward the eye of the observer, he sees the image at *m*, and by placing the paper below in this place the image may be traced with a pencil. The brass frame of the prism has usually two lenses, one concave and the other convex, the former to be used in front between *f* and *d c* for near-sighted persons, and the latter at *e* for those who are far-sighted. The size of the picture may also be increased or diminished by lengthening or shortening brass tubes connected with the frame. This instrument has undergone various modifications. It is extremely convenient on account of its portability.—**Camera obscura** (Latin, dark chamber), an apparatus in which the images of external objects, received through a convex lens, are exhibited distinctly and in their natural colors on a white surface placed at the focus of the lens. The simplest form of this instrument consists of a darkened chamber, into which no light is permitted to enter except by a small hole in the window-shutter. An image of the objects opposite the hole will then appear on the wall, or on a white screen so placed as to receive the light coming from the opening. A convex lens may be fixed in the hole of the shutter. Portable cameras are constructed of various forms, but the design of them all is to throw the images of external objects, as persons, houses, trees, landscapes, etc., upon a plane or curved surface, for the purpose of drawing, the making of photographic pictures, or mere amusement. The surface on which the image is thrown may be covered with a sheet of paper, on which the figure may be traced by hand with a pencil; but the picture is most distinctly seen when the image is formed on the back of a silvered mirror. The figure represents a portable camera obscura. The camera obscura is often made in the form of a circular building capable of holding a number of people, who stand about a plain white table which is placed in the center of the structure, and on which the luminous image is projected by a lens on the roof. By turning the lens around, a panorama of the neighboring scenery is exhibited on the table. Cameras for use in sketching are made in the shape of a cone, with a lens and a reflecting mirror at the apex and a drawing-table inside. One side of the box is cut out, and at this opening the artist sits, partly excluded by a dark curtain which serves to shut out extraneous light. See *optigraph*.

and directed toward the sun, the negative being placed near the lens and sheets of sensitive paper in the plane of focus. Copying cameras used with electric lights are also made of very great size, for producing life-size copies of portraits, the camera consisting essentially of a dark room in which the easel holding the prepared paper travels along the plane of focus on rails laid on the floor.—**Detective camera,** a portable photographic camera adapted for making instantaneous pictures, especially of moving objects, while it is carried in the hand or otherwise about the person. The exposure is made by means of a spring, the object to be photographed being brought within the range of the lens by means of a finder variously devised.—**In camera,** in *law,* in chambers; in private: applied to a trial conducted with closed doors for some special reason touching the nature of the case or the evidence.—**Multiplying camera,** in *photog.,* a camera fitted with a number of small lenses, so that it can take a number of pictures at one exposure. It is used for taking ferrotypes.—**Solar camera.** See *copying camera.*—**Stereoscopic camera,** a double camera giving two pictures upon the same plate, or a camera with a single lens and a shifting device for effecting the same end.

(2) Pret. *could* (the *l* being inserted in ignorant imitation of *should* and *would*, where the *l* is radical), < ME. *coude*, *couthe*, earlier *cuthe*, pl. *coude*, *couden*, *couthe*, *couthen*, earlier *cuthen*, < AS. *cūthe*, pl. *cūthon* (for **cunthe*, **cunthon*, the *n* being lost, as in *mūth*, mouth, *tōth*, tooth, etc.). (3) Inf. *can* (*to can*), assumed from the ind. form, occasionally used in mod. E. as a convenient substitute for *to be able*, or, as in the example cited from Bacon, analogously with *will* as an independent verb; ME. inf. *cunnen*, *cunne*, also *connen*, *conne* (usually 'to know,' rarely 'to can'), < AS. *cunnan*, scarcely used. (4) The ppr., ME. *cunning*, *kun-*

nynge, etc., earlier and north. form *cunnand*, is mod. E. *cunning*, with a partly deflected sense: see *cunning*, *a.*, and *cunning*, *n.* (5) The pp. *couth* is found in mod. E. only in comp. *uncouth*, and deriv. *kith*, *kithe*, q. v.; ME. *couth*, *coud*, *cuth*, < AS. *cūth* (for **cunth*, like pret. *cūthe* above), known. The ME. and AS. sense of *can* as an independent verb is 'know'; as an auxiliary, 'be able'; but the latter use is rare in AS., being supplied by *mæg*, E. *may*. The cognate forms (1st and 3d pers. pres. and pret. ind., and inf.) are: OS. *kan*, *konsta*, *kunnan* = OFries. *kan*, *kunda*, *kunna*, *konna* = D. *kan*, *konde*, *kunnen* = MLG. *kan*, *kunde*, *kunnen*, *konnen*, *konen*, LG. *kan*, *kunde*, *könen* = OHG. *chan*, *kan*, *chunda*, *chonda*, *konda*, *chonsta*, *konsta*, *chunnan*, MHG. *kan*, *kunde*, *konde*, *kunnen*, *künnen*, G. *kann*, *konnte*, *können* = Icel. *kann*, *kunni*, *kunna* = Sw. *kan*, *kunde*, *kunna* = Dan. *kan*, *kunde*, *kunne* = Goth. *kann*, *kuntha*, *kunnan*, know; prop. a preterit present, AS. *cann* being orig. a strong pret. (with pp. **cunnen*, whence the later weak pret. *cūthe*, and weak pp. *cūth*) of an assumed inf. **cinnan* (whence the factitive *cennan*, make known, = Icel. *kenna*, make known, know: see *ken*[1]), Teut. √ **kin*, **ken* (= Lith. *zinaú*, know, recognize, = OIr. *adgein*, perf., knew), orig. 'perceive, get knowledge of' (pret. 'have perceived, have gotten knowledge of,' and hence, in indefinite or present time, 'know'), this root being parallel with the ult. related **knā*, **knō* in AS. *cnāwan*, E. *know*, L. *gno-scere*, etc. (see *know*); in another view orig. 'beget, get' (pret. 'have gotten'), connected with AS. *cennan*, beget, produce, *cynn*, kin, *ge-cynd*, kind, etc., √ **ken*, L. **gen*, etc., but this root, though equally widely extended, appears to be fundamentally distinct from the root **ken*, know: see *ken*[2], *kin*[1], *kind*, *genus*, etc. Hence ult. *con*[1] (= *can*[1]), *con*[2], *cun*[1], *cun*[2], *cunning*, *couth*, *uncouth* (= *unco*), *kith*, *kithe*, etc.] **A.** As an independent verb.

See *channel*[1] and *kennel*[2], doublets of *canal*[1].] **1.** An artificial waterway for irrigation or navigation. Canals appear to have been first used for conveying water, and were merely shallow ditches with a slight fall. They naturally became, when large enough, a roadway for boats, and eventually for ships. A canal may be a mere cutting to unite bodies of water for the passage of boats, as in some of the chains of lakes in the eastern United States; or a continuous waterway formed by a series of long levels united by locks and carried over rivers and valleys by means of bridges, as the Erie canal; or a canalized river; or a navigable passage connecting lakes or seas, as the Welland canal in Canada, or the Suez canal. Among the longest canals are the Ganges canal in India, about 350 miles long, the Grand Canal in China, about 800 miles, and the Erie canal in New York, 363 miles. The James and Kanawha Rivers Navigation canal, 147 miles long, over-

came by its locks a grade of 1,916 feet, and the Morris canal in New Jersey, 101 miles long, one of 1,674 feet. The Suez canal (opened in 1869) is 87 miles long, and is level throughout. The Panama ship-canal is to be about 50 miles in length. The Chicago drainage canal (completed in 1899) is about 29 miles long: it can also be used by shipping. On ordinary narrow canals boats are usually drawn by horses or mules traveling on a tow-path, though steam-propulsion and steam and electric towing are now used to some extent; larger ones, called *ship-canals*, as the Suez, the North Holland, the Welland, etc., are navigated by vessels of different sizes, up to the largest under sail or steam.

In general, such candelabra consist of a long shaft or rod rising from a base with three feet, and supporting a circular cap or disk with elaborate ornamentation. Some examples are of enormous size and weight, covering at the base a triangle of 6 or 7 feet on each side, and rising to a proportionate height; these, often made of marble, were used in connection with religious observances, and were rather monuments or votive offerings than utensils.

> *Candid* and dispassionate men. *Irving*.

=**Syn. 2** and **3**. *Candid*, *Fair*, *Open*, *Frank*, *Ingenuous*, *Naïve*, *Sincere*, unprejudiced, unbiased. The first seven words apply to the spirit, expression, or manner. The *candid* man is able to look impartially on both sides of a subject, especially giving due weight to arguments or opinions opposed to his own, and due credit to the motives of opponents; *candid* speech is essentially the same as *frank* speech, sometimes going so far as to be blunt. *Fair* belongs primarily to conduct, but in regard to speech and thought it is the same as *candid*: as, a man preëminently *fair* in dealing with opposing views. *Open* is opposed to concealment; the *open* man does not cultivate a politic reserve, but expresses his opinions freely, without stopping to think of their effect upon his own interests. *Frank*, literally, *free*; the freedom may be in regard to one's own opinions, which is the same as *openness*, or in regard to things belonging to others, where the freedom may go so far as to be unpleasant, or it may disregard conventional ideas as to reticence. Hence, while *openness* is consistent with timidity, *frankness* implies some degree of boldness. *Ingenuous* implies a permanent moral quality, an elevated inability to be other than honest or open, even to one's own loss; there is a peculiar subjective cast to the word, as though the man stood most in awe of the disapprobation of his own judgment and conscience; hence the close connection between *ingenuousness* and *modesty*. *Naïve* expresses a real or an assumed unconsciousness of the way in which one's words meet conventional rules, or of the construction which may be put upon them by others; *naïveté* is thus an openness or frankness proceeding from native or assumed simplicity or artlessness. *Sincere* expresses the spirit and language that go with the love of truth; the *sincere* man is necessarily candid and fair, and as open and frank as seems required by truth.

Cannon are made of iron, brass, bronze, steel, or steel wire, and their projectiles weigh from 1 pound up to 2,000 pounds and more. The caliber or power of cannon may be expressed (1) by the weight of the

shot fired: as, a 32-pounder; (2) by the diameter of the bore: as, a 12-inch gun; or (3) by the weight of the gun itself: as, an 8-hundredweight gun; a 25-ton gun. Cannon may be classified according to the service for which they are intended into mountain, field, siege, or sea-coast guns; according to the kind of fire they deliver, into guns, howitzers, and mortars; according to the kinds of projectiles used, into smooth-bore and rifled; and according to the methods of loading, into muzzle- and breech-loaders. weighing more than 100 tons have seldom been constructed. Cannon of the smaller calibers are mounted on wheeled carriages for service as field-pieces. In the United States army the cannon in service are 3-, 3.2-, 3.6-, 5-, 7-, 8-, 10-, and 12-inch breech-loading rifled guns, and 3.6-, 7-, and 12-inch breech-loading mortars. A breech-loading, rifled, coast-defense gun of 16-inch caliber has been built. The charge for this gun is 640 pounds of smokeless powder, and the projectile weighs 2,400 pounds. The 3.2-inch gun is a steel field-piece. In the United States navy, 6-, 8-, 10-, 12-, and 14-inch steel guns have been adopted for ships of recent design. The principal parts of a cannon of old pattern are: 1st, the *breech*, which is the mass of metal behind the bottom or end of the bore; 2d, in muzzle-loading cannon, the *cascabel*, a projection in rear of the base-ring, including the *knob*, the spherical part between the knob and the base-ring being called the *base of the breech*; 3d, the *reinforce*, the thickest part of the cylinder, extending from the base-ring forward; 4th, the *trunnions*, which project on each side, and serve to support the cannon; 5th, the *bore*, the interior of the cylinder, wherein the powder and shot are lodged, and which may be smooth or rifled; 6th, the *muzzle* or *mouth* of the bore. In modern breech-loading ordnance we have also the *breech-plug* with its mechanism. Cannon were formerly classed as whole cannons, demi-cannons, culverins, sakers, etc. See *gun*.

The canoes of savage races are constructed of bark (as the birch-bark canoe of the American Indians) or hides, or formed of the trunks of trees, excavated by burning or cutting them into a suitable shape. The birch-bark canoes are light and can be carried on the shoulders, one large enough for four per-

sons sometimes weighing no more than 40 or 50 pounds. The modern canoe, employed chiefly for pleasure, is a light boat, carvel- or clinker-built, sharp at both ends and with a beam one eighth or one sixth its length; it is usually

2. *Eccles.*: (*a*) A law or rule of doctrine or discipline, enacted by a council or other competent ecclesiastical authority.

Various *canons*, which were made in councils held in the second century. *Hook.*

In the wording of a *canon*, it is not enough to admonish or to express disapprobation; its wording must be explicitly permissive or prohibitory, backed by the provision, expressed or admittedly understood, that its infringement will be visited with punishment. *The Churchman*, LIV. 462.

(*b*) In *liturgics*, that part of the liturgy or mass which includes the consecration, great oblation, and great intercession. It begins after the Sanctus (in the Roman liturgy, and other Latin liturgies influenced by the Roman, with the words *Te igitur*), and ends just before the Lord's Prayer, sometimes counted a part of it. The Roman canon is divided into ten portions or paragraphs, generally named from their initial words. See *liturgy*.

3. The books of the Holy Scripture accepted by the Christian church as containing an authoritative rule of religious faith and practice. With the exception of the books called *antilegomena*, the canonicity of which was not at first universally recognized, the canon of the New Testament has always consisted of the same books. The books comprised in the Hebrew Bible, and constituting the Hebrew canon, that is to say, the books of the Old Testament as given in the authorized version from Genesis to Malachi inclusive, are universally recognized as canonical. The canonical character of the books not found in the Hebrew, but contained in the Septuagint or Vulgate, was disputed by many in the early church; and although they are received without distinction by the Greek Church, and, with the exception of some among the number, by the Roman Catholic Church, they are not accounted canonical by the Anglican Church (which, however, treats them as *ecclesiastical books*, that is, books to be read in the church), nor by any of the Protestant churches. See *antilegomena, apocrypha*, 2, *deuterocanonical*, and *ecclesiastical*.

4. The rules of a religious order, or of persons devoted to a strictly religious life, as monks and nuns; also, the book in which such rules are written.—**5.** A catalogue or list; specifically, the catalogue of members of the chapter of a cathedral or collegiate church.—**6.** A catalogue of saints acknowledged and canonized, as in the Roman Catholic and Eastern churches.—**7.** In *art*, a rule or system of measures of such a character that, the dimensions of one of the parts being given, those of the whole may be deduced, and vice versa. A canon is established, for instance, when it is shown that the length of any well-proportioned figure is a certain number of times that of the head taken as a unit, and that the length of the head is contained a certain number of times in the torso or the legs.

8. In *music*, a kind of fugal composition in two or more parts, constructed according to the strict rules of imitation. One voice or instrument begins a melody, and after a few beats, the number depending upon the character of the melody, a second takes up the same melody at the beginning, at the same pitch or at some definite interval, and repeats it note for note, and generally interval for interval. The principle of the canon is that the second voice or instrument, when it begins the melody, must combine continuously, according to the strict rules of harmony, with that part at which the first voice has arrived, and when the third voice begins it must combine in the same manner with those parts at which the other two have arrived, and so on for any number of voices. A *round* is sometimes improperly called a *canon*.

Here we had a variety of brave Italian and Spanish songs, and a *canon* for eight voices, which Mr. Lock had lately made on these words: "Domine salvum fac Regem." *Pepys*, Diary, I. 26.

9. In *math.*: (*a*) A general rule for the solution of cases of similar nature. (*b*) An extensible table or set of tables. (*c*) A collection of formulas.—**10.** In *logic*, a fundamental and invariable maxim, such as, Nothing ought to be done without a reason.—**11.** In the *Kantian philosophy*, the science which determines the right use of any faculty of cognition: as, pure logic is the *canon* of the formal use of the understanding and reason; transcendental analytics is the *canon* of the use of the understanding a priori, and so on.—**12.** In *phar.*, a rule for compounding medicines.—**13.** In *Gr. hymnology*, a hymn consisting normally of a succession of nine odes, but usually of eight (sometimes of only three or four), the second being omitted, except in Lent, the numbers of the third, fourth, etc., however, remaining unaltered. See *ode, tetraodion, triodion*.—**14†.** Annual charge for use of land; rent; a quit-rent.—**15.** In *printing*, a large text printing-type, in size about 17½ lines to the linear foot: so called from its early employment in printing the canon of the mass and the service-books of the church.—**Ancyrene canons.** See *Ancyrene*.—**Apostolic canons.** See *apostolic*.—**Boole's canon,** in *math.*, a certain rule according to which a differential equation can be integrated if certain sufficient but not necessary conditions are fulfilled.—**Canon cancrizans.** See *cancrizans*.—**Canon law,** rules or laws relating to faith, morals, and discipline, enjoined on the members of any church communion by its lawful ecclesiastical authority; specifically, a collection of rules of ecclesiastical order and discipline embodied in the Corpus Juris Canonici (body of canon law). It is a compilation from the canons of councils, the decrees of the popes and fathers, and the decretals and canonical replies made to questions put at various times to the Roman pontiffs. The principal parts of which it consists are the Decretum, or collection of decrees made by Gratian A. D. 1151, and the decretals of Gregory IX., to which are added the decretals of Boniface VIII., the Clementine constitutions, and the books called the Extravagantes of John xxii. and the Extravagantes Communes. The canon law of the Church of England consists of canons passed in national and provincial synods and foreign canons adopted by custom and common law. The canon law of the Greek Church is embodied in the collections called the Syntagma Canonum, Nomocanon, and Synagoge Canonum of Photius. See *nomocanon*.—**Canon lawyer,** a person versed in the canon law.

It is held to be particularly illustrated in his figure called the *doryphorus* (which see).—**Canons of inheritance,** in *law*, rules directing the descent of real property.—**Circular canon,** in *music*: (*a*) A canon whose subject returns into itself; an infinite or perpetual canon. (*b*) A canon whose subject ends in a key one semitone above that in which it began, so that twelve repetitions traverse the circle of keys.—**Enigmatical canon, canon ænigmaticus, riddle canon,** in *old music*, a canon in which one part was written out in full and the number of parts was given; the remaining parts were to be written out by the student in accordance with the requirements of an enigmatical inscription written upon the music. See *inscription*.—**Perpetual canon,** in *music*, a canon so constructed that it may be repeated any number of times without break in time or rhythm.=**Syn.** *Ordinance, Regulation*, etc. See *law*[1].

In the Roman Catholic Church in England and elsewhere canons were formerly divided into three classes, *regular, secular*, and *honorary*. The *regular canons* lived in monasteries, and added the profession of vows to their other duties. *Secular* or *lay canons* did not live in monasteries, but they kept the canonical hours. *Honorary canons* were not obliged to keep the hours. The name *foreign canons* was given to such as did not officiate in their canonries: opposed to *mansionary* or *residentiary canons*. Canons of the English cathedrals must be in residence for three months each year. Collectively, with the dean at their head, they form the chapter. There are also canons of a lower grade, called *minor canons*, who assist in performing the daily choral service in the cathedral. *Honorary canons* may also be appointed, but receive no emolument.

cañon (kan′yọn; Sp. kän-yōn′), *n.* [Also, as English, *canyon*, the *ny* transliterating the Spanish *ñ*: Sp. *cañón*, tube, pipe, conduit, aug. of *caño*, a tube, gutter.] The name given throughout the Cordilleran region of the United States to any rather narrow valley with more or less precipitous sides; also a defile, ravine, or gorge. This use of the word *cañon* is peculiar to the United States, it being rare in Mexico, and not at all known in Spain or in Spanish South America. The word used in Spain and the Argentine Republic is *cañada*; in Peru, *quebrada*; and in Chile, *garganta*. A small and steep cañon, called in English *ravine, gorge*, or *gulch*, is known in Spain and Spanish America as *barranca* and *quiebra*. A cañon is a valley in its young stage of development; the work of erosion there exhibited is great and impressive, but it is small in comparison with that accomplished in many regions where the valleys have reached an old stage of development.

Thus, a binary quantic of the $(2m+1)$th degree can be expressed as the sum of $m+1$ powers.—**Canonical hours**, certain stated times of the day, fixed by ecclesiastical laws, appropriated to the offices of prayer and devotion. In the Roman Catholic Church the canonical hours are the seven periods of daily prayer, viz., matins (consisting of nocturns with lauds), prime, terce, sext, nones, evensong or vespers, and complin. In England the same name is also sometimes given to the hours from eight o'clock in the forenoon to three in the afternoon, before and after which marriage cannot be legally performed in a parish church without a special license.—**Canonical letters**, letters formerly interchanged by the orthodox clergy, as testimonials of their faith, to keep up the catholic communion, and to distinguish them from heretics.—**Canonical life**, the method or rule of living prescribed by the ancient clergy who lived in community. All through the Middle Ages the lawyer who was avowedly a priest held his own against the lawyer who professed to be a layman; and ours [England] is the only country in which, owing to the peculiar turn of our legal history, it is difficult to see that, on the whole, the *canonist* exercised as much influence on the course of legal development as the legist or civilian.

canonization (kan″on-i-zā'shon), *n.* [= F. *canonisation*, < ML. *canonizare*, canonize: see *canonize*.] In the *Rom. Cath. Ch.*, the act of enrolling a beatified person among the saints. See *beatification*. Originally each bishop was accustomed to declare that particular deceased persons should be regarded as saints; but the exercise of this power was gradually assumed by the popes, who since 1179 have exercised the exclusive right of canonization. In order to canonization, it must be shown that two miracles have been wrought by the candidate before beatification, and two more after it by his intercession. The pope, on application, resumes the case of the beatified person, with the view of testing his qualifications for the higher rank which is claimed for him. A secret consistory is summoned, at which three cardinals are appointed to inquire into the matter, who make their report at a second private meeting. In the third, which is a public consistory, one person, called the *advocatus diaboli*, or devil's advocate, attacks the person to be canonized, raises doubts as to the miracles said to have been wrought by him, and exposes any want of formality in the procedure; while another person, called *advocatus Dei*, or God's advocate, supports his claim. Lastly, a fourth consistory is held, in which the votes of the prelates are taken for or against the canonization. If a plurality of votes are cast in favor of the candidate, the pope announces the day appointed for the ceremony, which takes place at St. Peter's. Also spelled *canonisation*.

canonize (kan'on-īz), *v. t.*; pret. and pp. *canonized*, ppr. *canonizing*. 2. Receptivity; susceptibility to being passively affected in any way; power of receiving impressions, or of being acted upon.

Faculty . . . is properly limited to active power, and, therefore, is abusively applied to the mere passive affections of mind. *Capacity*, on the other hand, is more properly limited to these. Its primary signification, which is literally room for, as well as its employment, favors this; although it cannot be denied that there are examples of its usage in an active sense. Leibnitz, as far as I know, was the first who limited its psychological application to the passivities of mind. . . . The active [power] may be called faculty, and perhaps the passive might be called *capacity*, or receptivity.
Sir W. Hamilton, Metaphysics, Bowen's Abridgment, viii.

Capacity signifies greater passiveness or receptivity than . . . [power or faculty]. Hence it is more usually applied to that in the soul by which it does or can suffer, or to dormant and inert possibilities to be aroused to exertions of strength or skill, or to make striking advances through education and habit. *N. Porter*, Human Intellect, § 36.

3. Active power; ability: as, mental *capacity*; the *capacity* of a substance to resist pressure.

4. Ability in a moral or legal sense; legal qualification; legal power or right: as, a man or a corporation may have a *capacity* to give or receive and hold estate; A was present at the meeting in his *capacity* of director (that is, in virtue of his legal qualification as a director).

Breathing capacity. The capacity of a sphere is proportional to its radius, and in the C. G. S. system of electrostatic units is numerically equal to its radius expressed in centimeters. The capacity is increased by proximity to a charge of an opposite kind, as is shown by a condenser like the Leyden jar. The capacity of a condenser is proportional to the surface of the plates and to the dielectric constant or specific inductive capacity of the insulating medium, and inversely proportional to the distance between the plates. The *unit of capacity* is the farad, or, practically, the microfarad. See *farad*.—**Differential capacity, extreme differential capacity,** or **vital capacity,** the amount of air which can be expelled from the lungs by the greatest possible expiration after the greatest possible inspiration. It is usually about 214 cubic inches.—**Specific inductive capacity,** or **dielectric constant,** in *elect.*, the ratio of the capacity of a condenser using the substance spoken of as a dielectric, to the capacity of a similar condenser using air as the dielectric.—**Standard measure of capacity.** See *measure*.—**Thermal capacity** of a body, in *thermodynamics*, the quantity of heat required to raise its temperature by one degree on the absolute thermodynamic scale; also, capacity for heat.

If barren of ore, they are considered as belonging to the country. At the Mary Ann wheal (or mine) in Cornwall, and perhaps in other mines, the capel is called the *cab*; it is there described as consisting of chalcedonic quartz, and is considered as being a part of the lode, although barren of ore. Specifically, in *bot.*, resembling hair in the manner of growth: applied in this sense by Ray, Boerhaave, and other early botanists to ferns.

3. Resembling a single hair; specifically, in *anat.*, having (as a tube) so small a bore that water cannot be poured into it, and will not run through it.—4. Pertaining to a capillary or to capillaries: as, *capillary* circulation.

The quickness with which a withered slip revives on being placed in water, shows us the part which *capillary* action plays. *H. Spencer*, Prin. of Biol., § 12.

5. Pertaining to the phenomena of the rise of fluids in tubes and chinks, and, more generally, to the collecting of liquids in drops, their spreading over surfaces (as oil on water), and various other phenomena explicable proximately by surface-tension and ultimately by cohesion and adhesion, considered as forces acting at finite but insensible distances.—6. In *surg.*, linear: descriptive of a fracture of the skull without separation of the parts of the injured bones.—**Capillary antennæ**, in *entom.*, antennæ in which the joints are long, slender, and very loosely articulated, the outer ones being generally a little longer; this is regarded as a modification of the clavate type.—**Capillary attraction, capillary repulsion**, attraction or repulsion due to surface tension, that is, to the forces between the particles of the surface film of a liquid and between it and any body with which it is in contact. Floating bodies, as particles of sawdust, are drawn together and to the walls of the containing vessel by capillary attraction; two bodies, one of which is wet by the liquid while the other is not, repel each other. The rise of a liquid along the walls of a vessel wet by it and the elevation or depression of liquids in tubes are due to capillary action.—**Capillary bottle**, a bottle with a dropping-tube, used in preparing objects for the microscope.—**Capillary bronchitis.** See *bronchitis*.—**Capillary electrometer.** See *electro-capillary*.—**Capillary filter**, a simple water-filter, consisting of a cord of loose fiber, as a cotton candle-wick, one end of which is placed in the water, while the other end hangs over the edge of the vessel. The water is drawn through the cord by capillary action, without its impurities.—**Capillary repulsion.** See *capillary attraction*.—**Capillary tubes**, tubes with very small bores, of which the diameter is only a fraction of a centimeter. If a tube of this sort, open at both ends, is taken and one of its ends immersed in water, the water will rise within the tube to a sensible height above the surface of the water in the vessel, the height being inversely as the diameter of the bore; that is, the smaller the bore the greater the height. Different liquids rise in capillary tubes to different heights. The rise is explained by the action of cohesion as a force acting at insensible distances (hence called *capillary attraction*), which produces a tension of the superficial film of the liquid (see *surface-tension*) that exerts a pull upward where the surface is concave, as when the tube is moistened by the liquid (as glass or metal by water, alcohol, etc.), but a pressure downward where the surface is convex; consequently, those liquids which do not adhere to or wet the surface of the tube immersed in them stand lower within than without. Mercury, for example, is depressed in a glass tube, but rises in one of tin, to which it can adhere. The oil rises in the wick of a lamp or candle by this principle.—**Capillary vessels**, in *anat.*, the capillaries.

With reference to a corporation, it is the aggregate of the sum subscribed and paid in, or secured to be paid in, by the shareholders, with the addition of all undivided gains or profits realized in the use and investment of those sums; or if losses have been incurred, then it is the residue after deducting such losses. It. *capitolio*, < L. *capitolium*, < *caput* (*capit-*), the head: see *caput.*] **1.** In Rome, and in Roman cities and colonies, the precinct and temple of Jupiter Optimus Maximus, the protector of the city. The Capitol at Rome, situated on the southwestern summit of the Capitoline hill, was the center of the official religion of the state. In it the cult of Juno and of Minerva was associated with that of Jupiter. It was three times destroyed by fire, and each time restored with augmented magnificence; the last edifice continued to exist, though despoiled, till about the tenth century. The whole of the Capitoline hill (originally Mons Saturnius or Tarpeius) was also called the Capitol; on the second of its two summits was the citadel. The modern Capitol, or museum of the Capitol, stands in the space between the summits. Meetings of the senate and other legislative bodies have been held in or on the Capitol in both ancient and modern times. Literary references or inscriptions prove the existence of a capitol on the model of that in Rome in more than twenty provincial cities of Italy, Gaul, Spain, Africa, and the East; and there can be no doubt that a similar foundation was established in every regularly constituted Roman colony. The Roman capitol of Toulouse, which has been more than once renewed, has been the chief seat of authority in that city from medieval times to the present day.

The cake-bakers, being returned to Lerné, went presently, before they did either eat or drink, to the *Capitol*, and there before their king, called Picrochole, . . . made their complaint, showing their panniers broken, their coats torn, etc.

=**Syn. 1.** *Prisoner, Captive.* The word *prisoner* emphasizes the idea of restraint of liberty, but is not rhetorical or especially associated with feeling: the *prisoner* of war and the *prisoner* for crime may be shut up in a prison, kept by guards within defined limits, or given a restricted liberty on parole. The word *captive* suggests being completely in the power of another, whether confined or not; it has come to be a rhetorical word, suggesting helplessness and resulting unhappiness. Captured soldiers under guard are strictly *prisoners,* but are often and properly called *captives.* When we speak of a *captive* bird, we suggest its longing for liberty. The rights and interests of a *prisoner* are likely to be respected, but the *captive* may be abused or even sometimes sold into slavery. See *captivity.*

=**Syn.** *Imprisonment, Captivity, Confinement, Incarceration, Immurement.* There is the same distinction between *imprisonment* and *captivity* as between *prisoner* and *captive.* (See *captive.*) *Confinement* is the most general word for being kept within bounds against one's will, as by force or sickness; we speak of solitary *confinement,* and, figuratively, of too great *confinement* (though voluntary) to one's books. *Incarceration* is the being put into a jail or prison; the word is rhetorical, suggesting ignominy, with narrow range and great safeguards against escape. *Immurement,* literally shutting within walls, is now freely figurative; in either sense it suggests depth of separation or seclusion from friends, home, or the world, and small likelihood of getting or coming out. (See *servitude* and *serf.*)

and neck are extensively denuded; the legs and wings are comparatively long; the beak is toothless, with the cere ending vertically, the nostrils high up, linear, and oblique, with concealed tubercle. In this sense it has been used by most European ichthyologists since 1862. It includes fishes which have been distributed by others in the families *Carangidæ*, *Pomatomidæ*, *Psettidæ*, *Zanclidæ*, *Caproidæ*, *Equulidæ*, etc. (*b*) In Gill's system restricted to *Scombroidea* with 10 abdominal and from 14 to 16 caudal vertebræ, a short or atrophied first dorsal fin, second dorsal and anal long, opposite, and nearly alike, generally two anal spines detached and forming a finlet, and non-protractile jaws. These limits have been adopted by most recent American ichthyologists. It embraces numerous species of tropical fishes, the best-known of which are the cavallies, pompanos, and pilot-fish.

The oil of the African species, *C. procera*, called coondi, kundah, or tallicoona oil, is used by the negroes for making soap and anointing their bodies, its taste being so bitter that it serves as a defense against bites of vermin. carat, karat (kar′at), *n.* [Early mod. E. also ★*caract* (simulating *caract*, *character*, a character, mark, stamp); = D. *karaat* = G. *karat* (MHG. *karât*, *garât*) = Dan. Sw. *karat*, < F. *carat* = Pr. *carat* = It. *carato* = Sp. Pg. *quilate*, OPg. *cuirate* = Turk. Pers. *qīrāt*, < Ar. *qīrāt*, *qirrāt*, a carat, the twenty-fourth of an ounce, four barleycorns, also a pod, husk (= LL. *cerates*), < Gr. *κεράτιον*, the fruit of the locust-tree, also, like L. *siliqua* (see *siliqua*), a weight, the carat, also and lit. a little horn, dim. of *κέρας* (*κερατ-*), a horn, akin to E. *horn:* see *cerato-* and *horn*.] **1**†. An old weight equal to a scruple, or the twenty-fourth part of an ounce troy.—**2**†. A unit of mass formerly used in various countries for weighing gold. It was generally the 24th part of a mark of gold, and was subdivided into 12 grains. It was commonly equal to about 150.5 troy grains.

Hence—**3.** A twenty-fourth part: specifically used in expressing the fineness of gold when used as jewelry. Thus, pure gold being considered as 24 carats fine, if two, six, or ten twenty-fourths of alloy (commonly copper or silver) is present, the gold is said to be 22, 18, or 14 carats fine, and so on. The gold used by jewelers is seldom over 18 carats fine, except in wedding-rings, the standard fineness of which is 22 carats. Gold of 18 carats fine is almost invariably used in mounting diamonds, while 14-carat gold is said to be ordinarily used in the United States for gold chains, etc.

4. A unit of weight for precious stones, divided by jewelers into 4 grains, called *diamond-grains*, but equal to about $3\frac{1}{6}$ troy grains, $151\frac{1}{2}$ English carats being taken as equal to an ounce troy. In 1877 the weight of the carat was fixed by a syndicate of London, Paris, and Amsterdam jewelers at 205 milligrams, or 151.72 carats to the troy ounce. Under the translated form *κεράτιον*, or *ceratium*, siliqua was adopted by Constantine into the system of weights of the empire as $\frac{1}{144}$ of an ounce, equal to 189 milligrams. In Italy it remained as a part of the system of weights, in general with the same relation to the ounce and with nearly the same value. The Arabic *qirat* was the 24th part of the *mithkal*, and was subdivided sometimes into 4, sometimes into 3 grains, its value for gems being very nearly 3 grains troy. The Castilian carat, $\frac{1}{100}$ of a Castilian ounce, or 3.164 troy grains, was, like the rest of the Castilian system, adopted from the Arabs. From Spain this has passed to the rest of Europe and to America, with only small modifications, less than unlegalized units commonly undergo, under the name of the *Amsterdam* or *diamond carat*, which is usually divided into 64ths. Pearls are sold by the diamond-grain and not by the carat, while small baroque pearls, coral, rough garnets, and the inferior kinds of stones are sold by the ounce troy. The subdivisions of the carat are always expressed in fourths, eighths, sixteenths, etc. Since 1906 the new international carat of 200 milligrams has been adopted by most European countries, by Japan, and by leading associations in the United States (in effect July 1, 1913). From this product of coal-tar it is almost exclusively prepared. It has feeble acid properties, but in chemical structure is allied to the alcohols, and belongs to a class of compounds called *phenols*. When pure it crystallizes in white or colorless needles, which have the odor of creosote and a burning taste. They deliquesce readily and become liquid. It is an irritant poison when taken in large doses, but in doses of from 1 to 3 grains it is used internally as a therapeutic agent. Its chief medicinal use, however, is as a disinfectant in antiseptic surgery, and as an external application to unhealthy sores, compound fractures, abscesses after they have been opened, and tissues that are exposed as a result of surgical operations. The action of the acid is not only to exclude germs that induce putrefaction, but also to destroy such as may have been admitted, for which reason it is introduced into the interior of the wound. Also called *phenic acid*.—**Carbolic-acid paper**, wrapping-paper saturated with stearin and carbolic acid, used for preserving meats, etc.

F. *charbon* = Pr. *carbo* = Sp. *carbón* = Pg. *carvão* = It. *carbone*, a coal, coal, older forms, in orig. sense; < L. *carbo(n-)*, a coal, whether a glowing coal or a dead coal, charcoal.] 1. Chemical symbol, C; atomic weight, 12. An element found in nature in two distinct forms: the diamond, which is extremely hard, of high specific gravity (3.5), usually colorless and transparent, with brilliant adamantine luster, and crystallizes in octahedrons; and graphite, which is very soft, of low specific gravity (2), black and opaque, with metallic luster, and crystallizes in hexagonal plates. See *diamond* and *graphite*. Its physical properties vary greatly with its different forms. It is combustible, burning to carbonic acid (CO_2). In combination it is universally distributed through the animal and vegetable kingdoms being a constituent of every living tissue. By the action of heat on such tissues, with partial or complete exclusion of air, carbon is procured in amorphous form more or less mixed with other matters. Such products are animal charcoal, lampblack, wood charcoal, coke, and gas-carbon. The number of its compounds with the other elements is endless; and at present more compounds of carbon are known, probably, than of all other elements taken together. It is present in the atmosphere as carbon dioxid, or carbonic-acid gas, and in the same form in some mineral waters; it also appears in the salts called carbonates, as calcium carbonate in coral, in the shells of many sea-animals, in the common mineral calcite, including chalk, limestone, marble, etc., and as iron carbonate in the mineral siderite, etc. 2. The form of the diamond generally called *carbonado*; the black diamond.—3. In *electric lighting*, a carbon-point (see below).—**Bisulphid of carbon**. See *bisulphid*.—**Carbon dioxid**. Same as *carbonic acid* (which see, under *carbonic*).—**Carbon-points**, in *electric lighting*, two rods of very hard, compact carbon, between which the electric arc is formed, producing a light of great brilliancy. See *voltaic arc*, under *arc*, and *electric light*, under *electric*.—**Carbon process**, in *photog.*, a process of producing photographic positive pictures in a pigment composed of carbon, in order to insure their permanency. The thin paper on which the impression from the negative is taken is coated with gelatin colored with the carbon pigment, and sensitized, usually with bichromate of potash. After exposure to light under the negative it is affixed face downward upon another sheet of paper, and is plunged with it into a hot-water bath, which detaches the first paper and leaves the gelatin film uncovered. The water dissolves those portions of the film which have not been rendered insoluble by the action of light through the transparent portions of the negative upon the sensitizing medium, and the more or less insoluble portions of the film form a positive picture, which is, however, reversed in its relations of right and left. If a second transfer of the film from its support, to restore these relations in the finished print, is required, the first transfer is not made to a paper surface, but to a sheet of glass, zinc, or caoutchouc. The same end may be accomplished without the second transfer, by stripping the negative film from the glass, and printing with its face outward, by reversing the right and left of the negative by the use of a prism, or by other de-

vices.—**Carbon spar**, a name given to several mineral carbonates, as carbonate of magnesium, of zinc, etc.—**Carbon telephone**, a form of telephone invented by Edison, in which the vibrations of the diaphragm of the mouthpiece produce, by variable pressure upon a piece of compressed carbon placed in the circuit, variations in the electric current which induce sonorous vibrations in the receiver.—**Gas-carbon**, a form of amorphous carbon which is produced in the retorts where coal is heated for the manufacture of illuminating gas. It forms an iron-gray deposit on the sides and upper part of the retort. It is extremely hard, and is a good conductor of heat and electricity. It is used in the preparation of carbon battery-plates, and also for the carbon-points used with the electric arc-light. Also called *coal-gas charcoal* and *gas-graphite*.

carbona (kär-bō′nä), *n.* [NL.: see *carbon.*] In *mining*, a mass of stanniferous rock, irregular in form, and not possessing the general character of a lode. Such a mass, however, is ordinarily subordinate to a lode in its immediate vicinity. The carbona is in some respects analogous to the "pipes" and "flats" of the North of England lead-mines. The carbona of the St. Ives lode in Cornwall, England, was one of the most remarkable of these occurrences, and one of the first to which this name was given. It was composed of feldspar, quartz, black tourmalin (schorl), tin ore (cassiterite), and some cupriferous ore. It also contained fluor-spar, which was not present in the lode itself.

carbonaceous (kär-bo̤-nā′shius), *a.* [< *carbon* + *-aceous.*] Pertaining to or consisting of carbon; containing carbon or coaly matter.—**Carbonaceous shale**, a soft shaly rock through which coaly or bituminous matter is abundantly diffused in fine particles. Such shales are abundant in some parts of the United States, especially in the Devonian and Silurian series.

Orpen, tr. of Lavelaye's Socialism, p. 196.

Carbonaro (kär-bō-nä′rō), *n.*; pl. *Carbonari* (-ri). [It., lit. (as *carbonajo*), a charcoal-burner, < L. *carbonarius*, a charcoal-burner, a collier, < *carbo(n-)* (> It. *carbone*), coal, charcoal: see *carbon.*] One of the members of a secret political society called the *Carbonari*, formed in the kingdom of Naples during the reign of Murat (1808–14) by republicans and others dissatisfied with the French rule. They were originally refugees among the mountains of the Abruzzi provinces, and took their name from the mountain charcoal-burners. Their aim was to free their country from foreign domination. After having aided the Bourbons in the expulsion of the French, the organization spread over all Italy as the champions of the national liberal cause against the reactionary governments. At one time the Carbonari numbered several hundred thousand adherents. They were concerned in the various revolutions of the times until crushed out by the Austrian power in Italy. About 1820 they spread into France, and played an important part in French politics until the revolution of 1830.

Louis Napoleon began as a *Carbonaro* and conspirator, and narrowly escaped the fate which terminated the course of his elder brother and removed at least one rival out of his way. *W. R. Greg*, Misc. Essays, 1st ser., p. 154.

Also *carbonatation.*

carbon-black (kär′bon-blak), *n.* A fine lampblack used in making printing-inks and paints. It is made by directing the flames of gas-lamps, fed by natural gas from wells, against cold surfaces, and collecting by machinery the sooty deposit. It is almost pure carbon in a finely divided form.

carbon-button (kär′bon-but″n), *n.* A small disk of carbon, usually of compressed lampblack, used in a form of telephone invented by Edison. The resistance which it offers to the passage of an electric current depends upon the pressure to which it is subjected, so that when it forms a part of a circuit of constant electromotive force the current strength will vary with variations of pressure on the disk. See *carbon telephone*, under *carbon.*

★**carbonic** (kär-bon′ik), *a.* [= F. *carbonique* = Sp. Pg. It. *carbonico*, < NL. *carbonicus*, < *carbo(n-)*, carbon: see *carbon* and *-ic.*] Pertaining to carbon, or obtained from it.—**Carbonic acid**, CO_2, more properly called *carbonic anhydrid* or *carbon dioxid*, a gaseous compound of 12 parts by weight of carbon and 32 of oxygen, colorless, with pungent smell, 22 times as heavy as hydrogen, and existing in the atmosphere to the extent of 1 volume in 3,400. It is reduced to a liquid by high pressure and cold; and it is obtained as a solid white substance by means of the intense cold produced by the sudden evaporation of the liquid when allowed to escape from pressure. It has a pleasant, acidulous, pungent taste, and aërated beverages of all kinds—beer, champagne, and carbonated mineral water—in part owe their refreshing qualities to its presence; for, though poisonous when taken into the lungs, it is harmless when taken into the stomach in moderate quantity. Dissolved in water, it forms a dibasic acid, $CO(OH)_2$, whose salts, the carbonates, are widely and abundantly distributed in nature. It is incapable of maintaining combustion or animal life, acting as a narcotic poison when present in the air to the extent of only 4 or 5 per cent. It is disengaged from fermenting liquors and from decomposing vegetable and animal substances, and is largely evolved from fissures in the earth, constituting the choke-damp of mines. From its weight it has a tendency to subside into low places, vaults, and wells, rendering some low-lying places, as the upas valley of Java, and many caves, uninhabitable. This gas is formed and given out during the respiration of animals, and in all ordinary combustion, from the oxidation of carbon in the fuel. It is evolved from the colored parts of the flowers of plants both by night and day, and from the green parts of plants during the night. In direct or diffuse daylight, plants absorb it energetically from the atmosphere through their leaves, and decompose it, assimilating the carbon, and returning most of the oxygen to the air.—**Carbonic-acid engine.** (*a*) A fire-engine from which water is ejected by the pressure of carbonic-acid gas, which is evolved in a chamber connected with the water-reservoir. (*b*) An engine which is moved by the expansive force of condensed carbonic acid.—**Carbonic-acid water.** See *aërated waters*, under *aërate.*—**Carbonic** or **carbon monoxid**, a substance (CO) obtained by allowing carbonic acid to pass over red-hot fragments of charcoal, contained in a tube of iron or porcelain, and also by several other processes. It is a colorless, inodorous gas, a little lighter than air, has neither acid nor alkaline properties, is very poisonous, and burns with a pale-blue flame. This substance is produced when a coal-fire burns with a smokeless flame, and the pale-blue flame produced by its combustion may often be observed playing over such a fire.

Carbonidæ (kär-bon′i-dē), *n. pl.* [NL., < *Carbo(n-)* + *-idæ.*] A name of the cormorant family. *J. F. Brandt*, 1839. See *Phalacrocoracidæ.*

carboniferous (kär-bo̤-nif′e-rus), *a.* [< L. *carbo(n-)*, coal, + *ferre* = E. *bear¹.*] Containing or yielding carbon or coal. In *geol.*, almost exclusively used in designating that assemblage of strata from which the coal of England, France, Germany, and the United States is for the most part obtained. The Carboniferous series of limestones, sandstones, and shales belongs to the later era of the Paleozoic age. It is overlain by the Permian rocks, which represent the closing era of the Paleozoic age, and is underlain by the Devonian. The Carboniferous, over large areas both in Europe and North America, is separable into three more or less distinct groups: the coal-measures, the millstone-grit, and the mountain limestone. The first of these three is a series of shales and clays, with which the coal-beds themselves are interstratified. This part of the series is sometimes several thousand feet in thickness, and the number and thickness of the intercalated coal-beds differ greatly in different regions. The millstone-grit is a detrital rock ordinarily quite silicious, and assuming all degrees of fineness, from that of a fine-grained gritstone to that of a coarse conglomerate. Its thickness varies greatly in various regions. The mountain limestone is a calcareous rock, often rich in fossils of marine origin, and sometimes having a thickness of over 3,000 feet. See *coal, coal-measures, millstone-grit*, and *mountain limestone* (under *limestone*). [In technical use, commonly with a capital.]

A carcinoma is characterized microscopically by trabeculæ and nodular masses of cells of epithelial form and origin, running in a stroma of tissue of mesoblastic origin. Several types are distinguished: (1) flat-celled epithelioma; (2) cylinder-celled epithelioma; (3) simple carcinoma (carcinoma simplex), a variety of glandular carcinoma forming nodular tumors of considerable consistency; (4) carcinoma scirrhosum, or scirrhous cancer, a variety forming very hard nodules of almost the consistency of cartilage; (5) carcinoma gelatinosum, or cancer with colloid degeneration of the epithelial parts; colloid cancer; (6) carcinoma myxomatodes, or cancer with the stroma consisting of mucous tissue; (7) cylindroma carcinomatodes; (8) carcinoma gigantocellulare; (9) melanocarcinoma. Certain pathologists exclude the epitheliomata from the carcinomata, and hold that the latter are not of epithelial origin, but are purely a mesoblastic formation. Some, again, founding the definition of carcinomata entirely on anatomical features, independently of histogenetic considerations, include in them the sarcomata alveolaria. The softer carcinomata are as a rule the more rapidly fatal. The earlier a cancer is removed, the greater is the prolongation of life and the chance of escaping a return. carding-machine (kär'ding-ma-shēn″), *n.* A machine for carding fibers of wool, flax, or cotton, preparatory to drawing and spinning. In the earlier carding-machines the fibers were fed by hand to a cylinder upon which card-clothing was laid in strips parallel to the axis, and were removed from these strips by hand as they became full. In modern cotton-carding machines a loose roll of fibers, called a *lap*, is placed in guides and rests upon a roller, which as it revolves unwinds the lap and delivers it to the *feed-roll*, on passing through which it is seized by the card-teeth upon a small cylinder, called the *licker-in*, from which it is drawn by the teeth of the clothing of the main cylinder. Other small cylinders successively remove the fibers from and deliver them to the main cylinder. The tufts, tangles, or knots which are not loosened by the action of these cylinders project beyond the teeth of the main cylinder, and are caught by the teeth of a succession of wooden slats called *card-tops*, *top-cards*, or *top-flats*, from which they are cleared or stripped by hand or by mechanical devices. The fibers upon the main cylinder are laid parallel upon it, and are removed by means of the *doffer*, a cylinder moving in an opposite direction from the main cylinder and at a very much slower rate, and whose whole surface is covered by card-clothing. The cotton is stripped from the doffer in a thin continuous sheet of its full width, by means of a comb vibrating vertically in contact with the teeth of the doffer. This sheet of fibers is drawn together into a ribbon, traverses a funnel or trumpet, and is passed between successive pairs of rolls, which draw out and condense the sliver, and finally deliver it into the can ready for the *drawing-frame*, where it is doubled and drawn preparatory to twisting or spinning. For fine work, the operation of carding is repeated. The preparatory card or cards are called *breakers*, and those machines on which the carding is completed are called *finishers.* The principle of the wool-carding machine is identical with that of the cotton-carding machine, and it is chiefly distinguished from the latter by a great number of small cylinders called *urchins*, which work in pairs and are called *workers* and *cleaners.* The worker is the larger of the two; it strips the wool from the large main cylinder, and is itself cleaned by the smaller cylinder or cleaner, which delivers the wool back to the main cylinder, when it is again seized by the next worker. Wool-fibers are oiled to facilitate carding and to prevent felting.

Extraordinary care, ordinary care. See the adjectives.—**Take care**, be careful; beware.—**To have a care.** See *have*.—**To have the care of**, to have charge of.—**Syn.** *Care*, *Concern*, *Solicitude*, *Anxiety*. *Care* is the widest in its range of meaning; it may be with or without feeling, with or without action: as, the *care* of a garden. In its strongest sense, *care* is a painful burden of thought, perhaps from a multiplicity and constant pressure of things to be attended to: as, the child was a great *care* to her. *Concern* and *solicitude* are a step higher in intensity. *Concern* is often a regret for painful facts. *Care* and *concern* may represent the object of the thought and feeling; the others represent only the mental state: as, it shall be my chief *concern*. *Solicitude* is sometimes tenderer than *concern*, or is attended with more manifestation of feeling. *Anxiety* is the strongest of the four words; it is a restless dread of some evil. As compared with *solicitude*, it is more negative: as, *solicitude* to obtain preferment, to help a friend; *anxiety* to avoid an evil. We speak of *care* for an aged parent, *concern* for her comfort, *solicitude* to leave nothing undone for her welfare, *anxiety* as to the effect of an exposure to cold. (For *apprehension* and higher degrees of *fear*, see *alarm*.)

This mountain, overlooking the bay of Acre in northwestern Palestine, has been from early times a resort for hermits, and in 1156 Berthold, a Calabrian monk, in obedience to a professed revelation from the prophet Elijah, built there a tower and a church and gathered around him about ten companions. From this small beginning arose the Carmelite order. According to an early rule, the monks were to live in separate cells, to abstain from meat, and to observe a strict fast from the Exaltation of the Cross (September 14th) to Easter, Sundays being excepted. Owing to Mohammedan persecutions, the Carmelites abandoned Mount Carmel and established themselves in 1238 in Cyprus and elsewhere. In the sixteenth century St. Theresa, a Spanish lady of noble family, built a convent at Avila and established a discalced or reformed branch of the order, consisting of both monks and nuns, sometimes called *barefooted Carmelites*. The habit of the order is a cassock, scapular, and hood of brown color, and a white cloak, the hood covering the head and face and having holes for the eyes. There are convents of the order in the dioceses of New York, Leavenworth, Newark, Pittsburgh, Baltimore, St. Louis, and New Orleans. The three convents last named follow the rule of St. Theresa.

I. *n.* The principal artery of the neck of the higher vertebrates. There are usually two carotids, right and left, giving off few if any branches in the neck itself, but supplying the head. In man, the right carotid arises in common with the right subclavian from the innominate artery; the left arises directly from the arch of the aorta; both ascend the neck nearly vertically, but somewhat divaricating from each other, in front of the spinal column and on each side of the trachea, inclosed with the pneumogastric nerve and internal jugular vein in the carotid sheath, and divide opposite the upper border of the thyroid cartilage into the *internal* and *external carotids;* up to this division the right and left carotids are termed the *common carotids.* The *external carotids* are the outer of the terminal branches of the common carotids, supplying mainly parts of the head outside the brain-cavity; their branches are the superior thyroid, lingual, facial, occipital, posterior auricular, ascending pharyngeal, internal maxillary, and temporal arteries. The *internal carotids* are the inner of the terminal branches of the common carotids, ascending deeply along the side of the neck and entering the cavity of the cranium through the carotid canal in the temporal bone, supplying the brain and associate structures. (See cuts under *embryo* and *lung.*) A similar arrangement of the carotids is substantially repeated in mammals. In birds the disposition of these arteries varies much, but in most cases there is but one carotid, the left, or sinistrocarotid. Also *carotis.*

II. *a.* Of or pertaining to the two great arteries of the neck: as, the *carotid* canal. Also *carotic.*—**Carotid arteries.** See I.—**Carotid canal,** the passage by which the internal carotid artery enters the cavity of the cranium; in man, a sinuous canal through the petrous portion of the temporal bone.—**Carotid foramen.** See *foramen.*—**Carotid ganglion,** a small sympathetic ganglion occasionally found on the under surface of the internal carotid artery while in the carotid canal.—**Carotid gland,** in *embryol.*, the termination of the first or anterior primitive aortic arch, whence the internal and external carotids arise.—**Carotid groove,** the sigmoid groove on either side of the body of the sphenoid bone where the internal carotid artery and cavernous sinus lie. > The swains were preparing for a *carousal.*
> *Sterne*, Tristram Shandy, vii. 43.

=**Syn.** *Revel, Carousal, Wassail, Spree, Debauch, Saturnalia, Orgy* agree in expressing times of excess in drinking; some of them include other sensual pleasures. They are in the order of strength and consequent reprobation implied. A *revel* is accompanied with some drunkenness, disorder, and noise. A *carousal* is by derivation a time of drinking deeply; it may be a bacchanalian feast, a noisy, unrestrained drinking-bout. *Wassail* is limited by its associations with the past so as to be chiefly poetic or to express deep drinking. *Spree* is considered a colloquial word, but seems likely to win recognition as a convenient word for a period of drunkenness which incites to wild and reckless action. *Debauch* is distinctively excess, having less reference now than formerly to eating, applying chiefly to gross lewdness or drunkenness, which is often prolonged. *Saturnalia*, like *wassail*, has historical associations; it is a strong word for license, noisy revelry, gross and continued debauchery. *Orgy* is by derivation a secret nocturnal debauch, and by usage a time of joining in a wild or frantic abandonment to drunkenness or lust, or both—the extreme in that kind of misconduct. See *feast.*

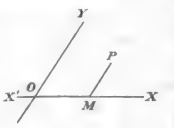
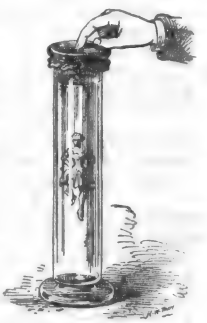
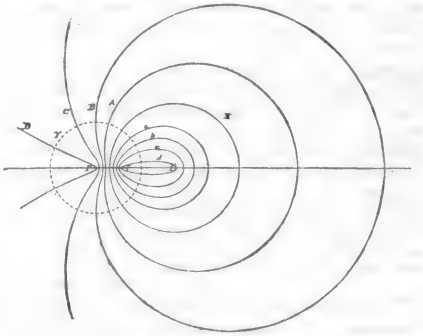
(See *tapestry*.) The first woven carpets were produced in Egypt, Babylonia, Persia, and Hindustan, whence they were introduced into Europe, where they are supposed to have been first manufactured by the French in the reign of Henry IV., and next in England, at Mortlake in Surrey, in the reign of James I. The pattern is dyed in the chenille itself, nothing showing at the surface of the carpet but the ends of the chenille fringe.—**Felt carpet**, a carpet in which the fibers are matted or felted together without spinning or weaving.—**Ingrain carpet**, a carpet made of wool dyed in the grain, or before it is manufactured. The warp and weft are of linen or hemp, and the tufts of colored wool are inserted by twisting them around the warp all along the row according to the weaver's taste, no pattern being used. A line of tufts being inserted, a shoot of the weft is made, and then beaten up to close the fabric.—**Pile carpet**, a carpet made in the same way as Brussels carpet, but having its loops cut, thus forming a pile or soft surface.—**Printed carpet**, a carpet dyed or printed in colors; it is either woven in undyed colors and printed like calico, or the yarn is dyed in sections, which are adjusted according to their future position in the fabric.—**Scotch carpet.** Same as *ingrain carpet*.—**To be on the carpet** (more commonly *on the tapis*: see below), literally, to be on the tablecloth or table, as for consideration; hence, to be under discussion; be the subject of deliberation or of intended action: a translation of the French phrase *être sur le tapis* (*tapis*, table-cloth, carpet, etc.: see *tapestry*).—**Turkish** or **Turkey carpet**, a carpet similar to the Persian, distinguished by the selection of the tufts of colored wool according to the pattern followed, and the manner of their attachment to the back. Cartesian (kär-tē'zi̯an), *a.* and *n.* [< F. *Cartésien* = Sp. Pg. It. *Cartesiano*, < *Cartesius*, Latinized form of *Cartes* in the name *Descartes* (*Des Cartes*), of which the first element is a removable prefix.] **I.** *a.* Pertaining to the French philosopher René Descartes (1596–1650), to his philosophy, or to his geometrical method. In order to put philosophy on a sound basis, Descartes professed to begin by doubting all things. But the doubt, the thought, could not be doubted; hence the fundamental proposition of his philosophy, *Cogito, ergo sum* (I think, therefore I am). This proposition (which is not a syllogism nor any formal mode of inference) means that, recognizing the fact that I think, I am irresistibly led to believe and clearly to discern that I exist, without being able to account for the inference. According to Descartes, the consideration that the conception of a deity involves the conception of a reality surpassing my own leads to the irresistible belief and clear perception of the existence of a God. Also, since veracity is an attribute of God, all that is clearly and distinctly apprehended must be true. This is the so-called *Cartesian criterion of truth*. Substances, he taught, are of two radically different kinds: the *material*, which are extended and not conscious, and the *spiritual*, which are conscious and not extended—a doctrine which is called *Cartesian dualism*. The *Cartesian doctrine of divine assistance*, or *occasionalism*, which was not fully developed by Descartes himself, is that whenever the soul makes a volition God intervenes to cause the corresponding motion of the body. He also taught that brutes are mere machines without consciousness (the *Cartesian automatism*), and that all space is filled with matter, which turns about in vortices, and so produces the motions of the heavenly bodies.—**Cartesian coördinates**, in *geom.*, the lines introduced (1637) by René Descartes for defining the positions of points in a plane. Two straight lines, OX and OY, are adopted arbitrarily as *axes of coördinates*, to which all positions are referred. Their point of intersection, O, is called the *origin of coördinates*. From any point, P, whose position is to be defined, a line, MP, is drawn parallel to OY, and meeting the axis OX in M. The length PM, or the *ordinate*, and the length OM, or the *abscissa*, being given, the position of P is determined; these lines are called the *Cartesian coördinates of the point P*. The term is sometimes extended to a similar system for three dimensions.—**Cartesian curve.** See II., 2.—**Cartesian devil, Cartesian diver,** or **bottle-imp**, a philosophical toy used to illustrate the principle of Archimedes, the law of equilibrium of submerged bodies, the transmission of pressure by fluids, etc. It consists of a hollow figure, usually in the fancied form of a demon, with a hole at some distance from the top. The figure is filled with air in the upper part and with water in the lower, and floats in a tall glass vessel of water covered air-tight with india-rubber or a piece of bladder. When this cover is pressed down, water enters the figure by the hole, compressing the air within. The figure consequently sinks, and does not rise again until the pressure is removed. Sometimes called the *Cartesian devil*.—**Cartesian geometry**, geometry treated by means of coördinates; analytical geometry. See *Cartesian coördinates*, above.—**Cartesian lens**, a lens so shaped that there is no spherical aberration; especially, a concavoconvex lens having one surface spherical and the other ellipsoidal. Such lenses were proposed by Descartes, but never successfully executed, and were shown later to be needless.—**Cartesian measure of force**, the measure of force as proportional to the velocity, founded on the observation that the same force is required to raise one pound two feet as to raise two pounds one foot. Owing to the confused notions of force of Descartes and his followers, it is impossible to say whether the principle as enunciated by them is correct or not; but its errors appear, at any rate, to have been corrected in the final development of the doctrine, though it is now superseded.—**Cartesian oval**, a curve, the locus of a point whose distances from two fixed points are connected by any given linear equation. A Cartesian oval is a real branch of a Cartesian curve. These ovals were first imagined by Descartes in connection with the theory of optics.





Cartesian Diver.



Confocal Cartesian Ovals.

F, *F*, *F'* are the foci; the ovals *a* and *A* form one quartic curve, likewise *b* and *B*, *c* and *C*, *d* and *D*; *x* is the intermediate circle, *y* the orthogonal circle.

II. *n.* **1.** One who adopts the philosophy of Descartes; a follower of Descartes.—**2.** Any curve of the fourth order having two cusps on the absolute. There are three genera of Cartesians. The first consists of curves of the sixth class, composed of a pair of Cartesian ovals, one inside the other. The second genus consists of curves of the fourth class, which are limaçons. Curves of this kind generally have an acnode which may become a crunode. The third genus consists of the cardioid, which is a curve of the third class with a real cusp. Every Cartesian has a single bitangent.—**Twisted Cartesian**, a curve in space, the locus of a point whose distances from three fixed points are connected by two linear equations.

Cartesians.

The full-line curve is a limaçon: without it and within the loop is a Cartesian of two ovals. On the other side of the limaçon is a Cartesian having only one real oval.

They are noted for their austerity. They support themselves by manual labor, mendicancy being forbidden. Their habit is a haircloth shirt, a white tunic, and, when out of doors, a black cloak and a cowl. The order was introduced into England about 1180, and built the Charterhouse (corruption of *Chartreuse*, used as the generic name of any Carthusian monastery) in London in 1371. The monks of Chartreuse now derive a considerable revenue from the sale of the well-known cordial, of their invention, which bears the name of the monastery. (See *chartreuse*, 2.) The Carthusian nuns originated about 1230, and, with some modifications, follow the rules of the Carthusian monks.

★**cartilage** (kär'ti-lāj), *n.* [< F. *cartilage* = Pr. *cartilage* = Sp. *cartílago* = Pg. *cartilagem* = It. *cartilagine*, < L. *cartilago* (*cartilagin-*), gristle; origin unknown.] A non-vascular animal tissue belonging to the connective-tissue group; gristle. Typical hyaline cartilage is a translucent substance, of firm elastic consistence, constructed of roundish cells embedded in a nearly homogeneous intercellular substance. Fibrocartilage differs in that the intercellular substance becomes fibrillated; it thus approaches ordinary connective tissue. Reticular, yellow, or elastic cartilage, as that constituting in man the epiglottis, the cornicula laryngis, the Eustachian tube, and gristly parts of the outer ear, contains interlacing elastic fibers in considerable quantity. In the two latter forms the homogeneous substance remains unchanged in the immediate vicinity of the cells, forming their hyaline capsules. Chondrin, a substance resembling gelatin, may be extracted from cartilage by boiling. Cartilage usually persists in parts of the skeleton of adult vertebrates, as on the articular ends of bones, in the thorax, and in various passages which require to be kept open, as the windpipe, nostrils, and ears.—**Alar cartilage.** See *alar*.—**Articular cartilage**, an incrustation of hyaline cartilage on the articular ends or surfaces of bones, not covered by perichondrium on its free surface, with a finely granular matrix and small cells, showing no tendency to ossify, its density, smoothness, and elasticity contributing to the free movement of the parts.—**Arytenoid cartilages**, two triangular pyramidal cartilages, seated, one on each side, on the summit of the posterior portion of the cricoid cartilage. To them are attached the posterior ends of the vocal cords.—**Cartilage of Wrisberg**, a small cartilage on either side in the arytenoepiglottic fold. Also called *cuneiform cartilage*.—**Carti-**

lages of Santorini, the horns of the larynx, or cornicula laryngis, borne upon the arytenoid cartilages.—**Cellular cartilage**, a variety of cartilage of which the notochord chiefly consists, composed almost entirely of large cells with the intercellular matrix at a minimum.—**Circumferential cartilage**, an annular piece of fibrocartilage forming a rim around and deepening some articular cavity, as in the shoulder-joint or hip-joint.—**Connecting cartilage**, a kind of fibrocartilage occurring in joints of slight mobility or none, as the pubic symphysis, the sacroiliac synchondrosis, and the intervertebral articulations.—**Costal cartilage**, the piece of cartilage which prolongs the bony part of a rib to or toward the sternum; a hemapophysis; a sternal rib when unossified. In man all the ribs have costal cartilages; 7 of these reach the sternum, 3 are connected only with one another, and 2 form cartilaginous tips of the floating ribs.—**Cricoid cartilage**, the cricoid.—**Cuneiform cartilage.** Same as *cartilage of Wrisberg*.—**Dental cartilage**, the maxillary ridge (which see, under *maxillary*).—**Ensiform cartilage**, the xiphoid appendage of the sternum; the last segment of the sternum, or the xiphisternum when unossified, as in man.—**Fibrous cartilage**, cartilage mixed with inelastic white or elastic yellow fibrous tissue: usually called *fibrocartilage* (which see).—**Hyaline cartilage**, true or pure cartilage or gristle. It is of a pale-livid or pearly-bluish color, and consists of roundish cells embedded in a nearly homogeneous intercellular substance, that is, unmixed with fibrous tissue. The articular and costal cartilages, and the temporary cartilages of the fetal skeleton, are of this kind.—**Interarticular cartilage**, a meniscus; a cartilaginous discoidal, crescentic, annular, or otherwise shaped piece occurring free in the interior of certain joints, and consisting of fibrocartilage, such as the semilunar cartilages of the knee-joint. In man interarticular cartilages occur in the temporomaxillary, sternoclavicular, acromioclavicular, ulnocarpal, and femorotibial articulations.—**Interosseous cartilage**, a piece of interarticular cartilage.—**Meckel's cartilage.** See *Meckelian rod*, under *rod*.—**Palpebral cartilage.** Same as *tarsal cartilage*.—**Permanent cartilage**, that which remains unossified throughout life.—**Semilunar cartilage**, one of the pair of large, free, crescentic interarticular cartilages of the knee-joint. See cut under *knee*.—**Sesamoid cartilage**, one of several small lateral cartilages of the nose.—**Siphon-hinge cartilage**, in cephalopods, one of two cartilaginous sockets on either side of the funnel, into which fleshy knobs of the mantle-skirt are fitted.—**Stratiform cartilage**, a layer of fibrocartilage in an osseous groove along which a tendon glides.—**Tarsal cartilage**, a piece of fibrocartilage embedded in the eyelid, contributing to preserve its shape. Also called *palpebral cartilage*.—**Temporary cartilage**, that cartilage which is replaced by bone in the process of ossification.

Colored cartoons intended to be woven in tapestry are cut in strips, placed under the web, and exactly copied by the weaver; the seven by Raphael, purchased by Charles I. of England, are well-known examples.

Encyc.—**4.** An oval or oblong figure on ancient Egyptian monuments and in papyri, containing groups of characters expressing the names or titles of royal personages and, rarely, of deities: a name given by Champollion. By extension it now commonly signifies both the inclosing ring and its contents. From a very early date, if not from the beginning, an Egyptian king at the moment of coronation assumed, in addition to his family or personal name, an official, regal, or throne name, which took its place beside the former, generally preceding it, and thus gave occasion to a double cartouche. In imitation of the German *schilde* employed in a heraldic sense, the cartouche is in English sometimes styled a *shield* or *escutcheon*, or more often merely an *oval*.

In the United States the car-body is supported upon two independent trucks placed beneath it. Each of these may have two, but usually four, and occasionally six wheels fixed upon revolving axles, whose journal-boxes vibrate vertically in pedestals secured to the framework of the truck. The bolster or cross-beam which directly supports the car-body is in the middle of the framework, and is suspended from it by equalizing bars and suspension-straps, in such a way as to distribute the weight upon all the wheels and allow for the sway, or freedom of motion, essential to easy riding. Springs and brake mechanism are attached to the truck. —**Side bearings of a car-truck.** See *bearing.*

caruca†, **carruca**† (ka-rö'kä), *n.* [ML., a plow, L. *carruca,* a four-wheeled carriage, < *carrus,* a car: see *car*[1]. Cf. *carue.*] In ancient village communities in England—(*a*) A plow. (*b*) A plow-team of oxen, yoked four abreast.

Information from the same source [Statistical Account of Scotland] also explains the use of the word *caruca* for plough. For the construction of the word involves not 4 yoke of oxen, but 4 oxen yoked abreast, as are the horses in the *caruca* so often seen upon Roman coins. And the "statistical account" informs us that in some districts of Scotland in former times "the ploughs were drawn by 4 oxen or horses yoked abreast; one trod constantly upon the tilled surface, another went in the furrow, and two upon the stubble, or white land. The driver walked backwards, holding his cattle by halters, and taking care that each beast had its equal share in the draught."
Seebohm, Eng. Vil. Community, p. 63.

It succeeded the Danegeld (which see).

The other remarkable matter of the year 1198 is the imposition of a *carucage*—a tax of five shillings on each carucate or hundred acres of land.
Stubbs, Const. Hist., § 150.

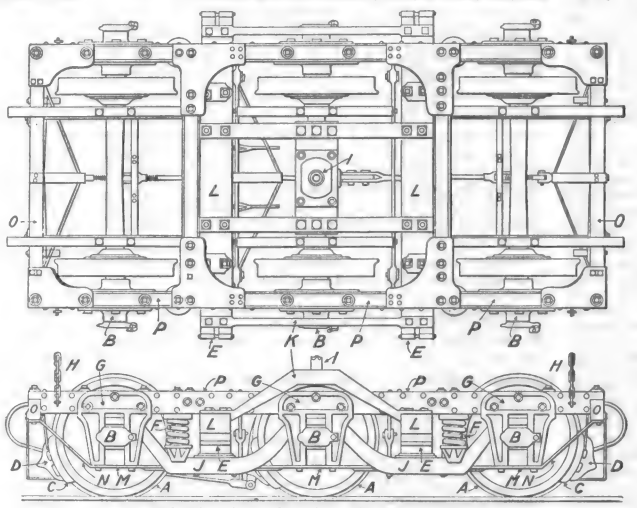
Also formerly *caruage.*

carucate, carrucate (kar'ö-kāt), *n.* [< ML. *carucata, carrucata,* < *carruca,* a plow: see *caruca.*] Formerly, as much land as could be cultivated by one caruca: usually about 100 acres, but the quantity varied according to the nature of the soil and the practice of husbandry in different districts. Also *carue.*

A trace at least of the original reason of the varying contents and relations of the hide and virgate is to be found in the Hundred Rolls, as, indeed, almost everywhere else, in the use of another word in the place of hide, when, instead of the anciently assessed hidage of a manor, its more modern actual taxable value is examined into and expressed. This new word is *carucate*—the land of a plough or plough team.
Seebohm, Eng. Vil. Community, p. 40.

carue† (kar'ö), *n.* [Later misread and miswritten *carve;* < ME. *carue,* < OF. *carue, caruee,* < ML. *carucata, carrucata,* a certain portion of land: see *carucate.*] A carucate (which see).

And a *Carve* of Land, Carucata terræ, or a Hide of Land, Hida terræ (which is all one), is not of any certain content, but as much as a Plough can plough in a Year, and therewith agrees Lambard verbo Hyde. And a *Carve* of Land may contain an House, Wood, Meadow, and Pasture, because by them the Ploughman and the Beasts of the Plough are maintained.
Anthony Lowe's Case (1610), 9 Coke, 123, 124.



Side Elevation and Section of Sleeping-car Truck.

A, flange of wheel; *B,* journal-box; *C,* brake-shoe; *D,* brake-head; *E,* bolster-spring; *F,* equalizing-bar spring; *G,* pedestal; *H,* check-chain; *I,* center-pin or king-pin; *J,* equalizing-bar; *K,* center-bearing inverted arch-bar; *L,* spring-beam; *M,* pedestal tie-bar; *N,* pedestal brace; *O,* end piece of truck-frame; *P,* wheel-piece.

And it was agreed that common way be appendant to a *Carve* of Land, . . . and so a *Carve* of Land consists of Land, Meadow, and Pasture, as it appears by Tirringham's case, 4 Coke, 37 b.
Mors v. Webbe (1652), 2 Brownlow (& Goldsborough), p. 297.

The Manx have a literature—a native vernacular Gaelic literature. . . . This literature consists of ballads on sacred subjects, which are called *carvals.* . . . It was formerly the custom in the Isle of Man for the young people who thought themselves endowed with the poetic gift to compose carols some time before Christmas, and to recite them in the parish churches. Those pieces which were approved of by the clergy were subsequently chanted by their authors through their immediate neighbourhoods, both before and after the holy festival. Many of these songs have been handed down by writing to the present time. . . . The *carvals* are preserved in uncouth-looking, smoke-stained volumes, in low farm-houses and cottages situated in mountain gills and glens.

The best-known species, *C. urens*, called the *bastard sago*, is a native of India, and is of great value. By severing the ends of the successive flowering stems a sweet sap is obtained, which is either boiled down into syrup and sugar, or made by fermentation into toddy, which yields arrack by distillation. The soft pith abounds in sago-like farina, which is made into bread or eaten as gruel. The outer part of the stem is hard, strong, and durable, and is much used for building and for agricultural implements; and the sheaths of the leaves yield a very strong fiber, known as *kittul fiber*, which is said to be indestructible.

3. In *med.*, an instance of disease under or requiring medical treatment, or the series of occurrences or symptoms which characterize it: as, the doctor has many *cases* of fever in hand; the patient explained his *case*.—**4.** A state of things involving a question for discussion or decision.

> Tell hym how the *caas* stant all as it is.
> *Merlin* (E. E. T. S.), iii. 491.
>

> *Sir Luc.* Pray, what is the *case*?
> *Sheridan*, The Rivals, iii. 4.
>
> The plainest *case* in many words entangling. *J. Baillie.*

Specifically—**5.** In *law:* (*a*) A cause or suit in court; any instance of litigation: as, the *case* was tried at the last term. In this sense *case* is nearly synonymous with *cause*, which is the more technical term. *Case* includes special proceedings, as well as actions at law, suits in equity, and criminal prosecutions; and it implies not only a controversy, but also legal proceedings. More loosely, however, it is used for cause of action: as, he has a good *case*.

> This false juge . . . sat in his Consistorie,
> And gaf his doomes upon sondry *cas*.
> *Chaucer*, Doctor's Tale, l. 163.
>
> Force a composition or wrangle out some broken Title, or breake the necke of the *Case* with a Prohibition.
> *Purchas*, Pilgrimage, p. 133.

(*b*) The state of facts or the presentation of evidence on which a party to litigation relies for his success, whether as plaintiff or defendant: as, in cross-examining plaintiff's witness, defendant has no right to go beyond the limits of the direct examination, for such inquiries are part of his own *case*. (*c*) Under American procedure, a document prepared by the appellant on an appeal, containing the evidence, or the substance of it, and the proceedings on the trial in the court below. It is intended to enable the appellate court to review the evidence and the facts, as well as to pass upon alleged errors of law, and in this differs from a *bill of exceptions*, which presents only alleged errors of law. Called specifically *case on appeal*.

6. In *gram.*, in many languages, one of the forms having different offices in the sentence which together make up the inflection of a noun: as, the *nominative case*, that of the subject of the verb, as *he, dominus* (Latin); the *accusative* or *objective case*, as *him, dominum;* the *genitive* or *possessive case*, as *his* (John's), *domini*. These are the only cases in modern English, and the objective is not distinguished in form from the nominative except in a few pronouns. In addition to the three cases found in English, Greek and German have a dative, Latin has a dative, an ablative, and a vocative, and Sanskrit further an instrumental and a locative. The French has lost all case-distinction in nouns. Some languages, as the Finnish and Hungarian, have many more cases, even fifteen or twenty. All the cases but the nominative are called *oblique cases*.

7. A person who is peculiar or remarkable in any respect: as, a queer *case;* a hard *case:* sometimes used without qualification: as, he is a *case*. [Colloq.]

> "Well, the General can tell you," says the hunter, glancing at that individual, "what a terrible hard *case* I've been." *W. M. Baker*, New Timothy, p. 114.

8. In *logic*, a proposition stating a fact coming under a general rule; a subsumption.— **Action on the case**, in *law*, a general form of action (the phrase being originally equivalent to *action on the circumstances*) adopted to enlarge the legal remedies at a time when forms of action existed for trespasses with violence and for debts resting in bond, but no form had been provided for wrongs without violence, such as negligence, or oral or implied promise. It became the most widely used of all common-law forms, and equally applicable to consequential injury to the real or personal property and to the personal character of the party by whom it was brought. —**Amistad case**, a noted case in the courts of the United States, in which Spaniards claimed as their slaves negroes who had been kidnapped in Africa, and who while

being carried to Cuba (in 1839) rose against their captors, took possession of the vessel, and after changing her course were taken by a United States vessel off the American coast. The courts held that they were free, and not pirates or robbers.—**Bankers' case,** or **case of the bankers,** the petition of Hornblee and others to the barons of the exchequer in 1691 (14 How. St. Tr., 1) for the payment of certain annuities granted by Charles II. to repay money originally loaned to him on the security of the revenues. On appeal, the House of Lords decided that the grant was binding upon his successor, and continued a charge upon the revenue.—**Bates's case,** an English prosecution (1606) of a merchant, in which the claim of James I. to impose duties as a personal prerogative was sustained: a question afterward settled the other way under Cromwell. Also called the *case of the impositions.*—**Bradlaugh's case,** a prolonged controversy (1881–88) over the claim of Charles Bradlaugh (*a*) to take a seat in the House of Commons without taking the oath required of members, he declaring that he did not acknowledge or believe in its obligation; and later (*b*) to have the oath administered. Two notable legal decisions were reached in the course of the controversy: first, that courts cannot control the House in its administration of laws relating merely to its internal procedure, nor inquire into the propriety of a resolution restraining a member from doing in the House what he had a lawful right to do, and that action will not lie against the sergeant-at-arms for obeying such resolution; second, that a member who does not believe in a Supreme Being, and upon whom an oath is binding only as a promise, is incapable of taking the prescribed oath; and if he goes through the form of taking it by administering it to himself he is liable for violation of the act.—**Burr's case,** the prosecution of Aaron Burr for treason against the United States, tried before Chief Justice Marshall in 1807.—**Calvin's case,** also called the *case of the postnati,* 1608 (2 How. St. Tr., 559; 7 Coke, 1), an action turning on questions of allegiance and natural-born subjects. It was brought to recover lands by Robert Calvin against Richard and Nicholas Smith, to which defendants pleaded that the plaintiff was an alien, and incapable of bringing the action, because he was born in Scotland, though after the crown of England descended to James I., who was also king of Scotland. It was argued by lawyers and judges of the greatest renown, including Lords Bacon, Coke, Ellesmere, Yelverton, and Warburton, and was decided in favor of the plaintiff.—**Case agreed,** or **case stated,** in *law,* a statement of facts agreed on by the parties, or made by another court, to be submitted merely for decision of a point of law.—**Case law.** See *law.*—**Case of conscience.** See *conscience.*—**Case of the Caroline.** See *McLeod case,* below.—**Case of the claimant.** See *Tichborne case,* below.—**Case of the seven bishops.** See *bishop.*—**Case reserved, case made,** a statement presenting points of law reserved by the judge or parties for decision by the full court.—**Civil rights cases.** See *civil.*—**Clinton Bridge case,** an important litigation in the United States Supreme Court (1870), which established the doctrine by which railroad bridges may be said to have gained clear recognition of their rights of way in preference to the navigable waters crossed by them, through the power of Congress to regulate inter-state commerce.—**Criminal cases.** See *criminal.*—**Crown cases reserved.** See *crown.*—**Darnell's case,** a noted case in English constitutional law (1627), in which the imprisonment of Sir Thomas Darnell and four others, for refusing to subscribe to a forced loan, was sanctioned, the agitation resulting from which was followed by the granting of the Petition of Right.—**Dartmouth College case,** the leading American case (1819) on the vested rights of corporations, reported as Trustees of Dartmouth College *v.* Woodward (4 Wheaton, 518), deciding that a corporate charter, even though it be a British charter granted before the revolution, cannot be materially altered by a State legislature, it being a contract within the meaning of the provision of the United States Constitution which deprives the States of the power to impair the obligation of a contract.—**Dr. Bonham's case,** an important decision upon English constitutional law, rendered in 1609, in the case of Thomas Bonham *v.* the College of Physicians (8 Coke, 107), for false imprisonment. It was held that an act of Parliament which is against common right and reason, or is impossible to be performed, is void by the common law; also, that where the power to commit to prison is vested by patent or act of Parliament in parties not being a court, their proceedings ought to be of record, and the facts upon which such power is exercised are traversable.—**Dred Scott case,** a case of great historical importance among the events which preceded the abolition of slavery in the United States, in which the Supreme Court held (in 1857) that a free negro of slave ancestry was not a citizen, and could not sue or be protected as such in the United States courts. The statement that the Africans in America had long been considered a subordinate race having "no rights which the white man is bound to respect," which was contained in the opinion of the chief justice, gained universal attention as a point of attack in the controversy about slavery.—**Five per cent. cases,** a decision of the United States Supreme Court in 1884 (110 U. S., 471), holding that an act of Congress by which a percentage of the proceeds of land "sold by Congress" is reserved to certain public uses of a State does not include lands disposed of by the United States in satisfaction of military land-warrants.—**General case,** in *math.,* that special state of things which is considered when, in studying an analytical expression, it is assumed that there is no peculiar relation between the constants denoted by letters. The general case may be very exceptional. Thus, in linear associative algebra, in the general case the vanishing of a product implies the vanishing of one of the factors, yet among the innumerable possible algebras there are but three in which such an inference is valid.—**Hampden's case.** See *case of ship-money,* under *ship-money.*—**In case,** in the event or contingency; if it should so fall out or happen that; supposing.—**Irreducible case,** in *math.,* the case in which a cubic equation has three real roots, when Cardan's method of solution involves imaginaries.—**Kendall's case,** a decision of the United States Supreme Court (1838), noted in American constitutional law, that the court may compel a cabinet officer to perform a ministerial duty.—**Knight case,** a decision by the United States Supreme Court in 1895, in which the E. C. Knight Co. and other companies subsidiary to the American Sugar Refining Co. were allowed to continue in combination on the ground that they were manufacturers and not engaged in trade or commerce and were therefore outside the Antitrust Act of July 2, 1890.—**Koszta's case,** the facts and resulting diplomatic correspondence (1853) by which the United States government maintained the claim that Martin Koszta, a native of Hungary, was entitled to protection as an American citizen from seizure by the Austrian government while in Turkish jurisdiction, he having previously legally declared his intention to become an American citizen.—**Marbury's case,** a decision of the United States Supreme Court (1803), noted in American constitutional history, which established the power of that court to declare an act of Congress void for contravening the United States Constitution, and defined the extent to which members of the cabinet are amenable to the courts.—**McLeod case,** a controversy between the United States and Canada, arising out of the incident of the destruction of the American steamer Caroline by the Canadian authorities (1837), in the course of which a man was killed. McLeod was arrested as one of the attacking party, and was indicted (1841) in New York State for murder; but he proved an alibi, and was acquitted. Also called the *case of the Caroline.*—**Negro case.** See *Sommersett's case,* below.—**Northern Securities case,** a leading decision, March 14, 1904, by the United States Supreme Court, wherein the Antitrust Act of July 2, 1890, was held to forbid the control of two competing railroads by a holding company, and such holding company (the Northern Securities Co.) was prohibited from acquiring further stock in such railroads and the exercise of voting or dividend rights on stock already held.—**Shelley's case,** the decision in 1581 (1 Coke, 89–106), by all the judges of England, of the case of Nicholas Wolfe against Henry Shelley, in ejectment, involving questions upon the law of common recoveries. It is chiefly celebrated for a precise and clear statement by defendant's counsel of a previously well-established rule of law concerning the effect of the word "heirs" in certain conveyances, since known as the rule in Shelley's case. This rule, which is now regarded as a rule of interpretation rather than a rule of law, is to the effect that wherever there is a limitation to a man, which if it stood alone would convey to him a particular estate of freehold, followed by a limitation to his heirs or to the heirs of his body (or equivalent expressions), either immediately or after the interposition of one or more particular estates, the apparent gift to the heir or heirs of the body is to be construed as a limitation of the estate; that is to say, not a gift to the heir, but a gift to the person first named of an estate of inheritance, such as his heir may take by descent.—**Sommersett's case,** a famous habeas corpus case in England in 1772, before Lord Mansfield, brought on behalf of Thomas Sommersett, a negro. It established the principle that a slave brought upon English soil became thereby free. Also called the *negro case.*—**Special case,** a statement of facts agreed to on behalf of two or more litigant parties, and submitted for the opinion of a court of justice as to the law bearing on the facts so stated. In Scots law, in civil jury causes, a special case differs from a special verdict only in this, that the special verdict is returned by the jury, whereas the special case is adjusted by the parties themselves, or by their counsel, and sets forth the special facts on which they are agreed without the evidence.—**Standard Oil Case,** one brought in 1906 by the United States against the Standard Oil Company of New Jersey and sixty-two other corporations and seven individuals to dissolve the holding company or combination formed by them, known as the Standard Oil Trust, for the control of the output of petroleum and its products. The decision, May 15, 1911, found the Standard Oil Trust to be a combination in restraint of interstate trade and commerce and directed its dissolution within six months. This decision of the Supreme Court is notable for its emphasis on the standard of reason in dealing with cases subject to the Antitrust Act of July 2, 1890.—**Taltarum's case,** a noted decision in 1473, establishing the power of a tenant in tail to convert the estate into a fee simple absolute by suffering a common recovery.—**Tennessee bond cases,** a name given to seventeen cases decided by the United States Supreme Court in 1885 (114 U. S. Sup. Ct., 663), wherein it was held that the statutory lien upon railroads created by act of the Tennessee Legislature, February 11, 1852, was for the benefit of the State, and not of the holders of State bonds issued under that act.—**Tichborne case,** also called the *case of the claimant,* the name given to the history and proceedings of Thomas Castro, otherwise Arthur Orton, in his claim to be Sir Roger Tichborne, and heir to the estate and baronetcy of Tichborne in England (1868–74), which he prosecuted by suits in Chancery and in the Courts of Probate and of Common Pleas, and which culminated in his trial and sentence to fourteen years' imprisonment for perjury. The case is celebrated for the conflicting nature of the testimony as to his identity, and for the great public interest excited by it.—**Tobacco case,** a Supreme Court decision in a suit brought by the United States in 1907 against the American Tobacco Company, a combination of tobacco concerns having a capitalization of $180,000,000, which consumed 45 per cent. of the tobacco made up in the country. The decision (May, 1911) found the combination unlawful under the Antitrust Act, and directed its dissolution.—**To put the case,** to suppose the event or a certain state of things; state a question, especially in a manner to invite decision.—**Tweed's case,** the proceedings against William M. Tweed and others, known as the Tweed Ring, for frauds perpetrated while they were municipal officers of New York, by which they obtained over six million dollars from the county of New York. In a civil case it was decided in 1874 that an action for money fraudulently obtained from a county could not be brought in the name of the people of the State. This was subsequently remedied by statute, and a judgment obtained. In a criminal case, Tweed was found guilty on twelve counts for similar offenses in one indictment, and was separately sentenced to one year's imprisonment on each, with the direction that service of one sentence should not begin until the completion of service on a prior sentence. After completing the term of his first sentence, a writ of habeas corpus was served on his jailer, and in 1875 it was decided that cumulative sentences in such cases were not lawful, and he was discharged, but he was immediately imprisoned in default of bail in preceding civil suits. Other minor decisions on questions of procedure are also included under this term.—**Twyne's case,** the leading case in English law (1603) holding that a conveyance intended to defraud creditors is void as against them, if not taken in good faith and for valuable consideration.—**Tyrrel's case,** a noted decision in English law (1558), in which after Parliament, by the statute of uses, had thought to put an end to the holding of land in the name of one person to the use of another, the courts introduced the doctrine of a use upon a use, leading to the present law of trusts.—**Virginia coupon cases,** the generic name under which are known a number of suits determined by the United States Supreme Court in 1884, enforcing a Virginia statute which declared coupons on bonds of that State receivable in payment of State taxes, notwithstanding the repeal of that statute.—**Wheeling bridge case,** the case of Pennsylvania *v.* Wheeling and Belmont Bridge Co., decided by the United States Supreme Court (in 1851 and 1855), concerning a bridge across the Ohio river at Wheeling, Virginia. After holding in 1851 (13 How., 518), by a divided court, that a bridge, though entirely within the jurisdiction of the State that authorized its construction, could be enjoined as a nuisance by the courts of the United States if it obstructed inter-state navigation, the court held in 1855 (18 How., 421), that Congress, under the constitutional power to regulate commerce between the States, may determine what shall or shall not be deemed an obstruction to navigation, and may declare a bridge, when erected, to be a lawful structure so as to avoid the effect of its having been judicially declared a nuisance.—**Wild's case,** an English decision, in 1599 (6 Co. Rep., 16 b), in the case of Richardson *v.* Yardley, in ejectment: so called because involving a devise to one Rowland Wild, which established the rule for the construction of wills known as the rule in Wild's case, viz., "that if A devises his lands to B and his children or issues, and he hath not any issue at the time of the devise, that the same is an estate tail."=**Syn.** Situation, condition, state, circumstances, plight, predicament.

caste[2] (kȧst), *n.* [Formerly *cast*, only recently ★as F. *caste*, < Pg. *casta* (> Sp. *casta*), breed, race, caste; first applied to the classes of the Hindus by the Portuguese, who were the earliest colonists in India; prop. fem. of *casto*, < L. *castus*, pure, > OF. *chaste*, E. *chaste*, q. v.] 1. One of the artificial divisions or social classes into which the Hindus are rigidly separated according to the religious law of Brahmanism, and of which the privileges or disabilities are transmitted by inheritance. The original castes were four in number: 1st, the Brahmans, or the sacerdotal caste; 2d, the Kshatriyas, modern Rajputs, or military caste; 3d, the Vaisyas, or husbandmen and merchants, who have now in many districts become merged in the second and fourth castes; 4th, the Sudras, or laborers and mechanics. The Brahmans are supposed to have sprung from the mouth of Brahma, the Kshatriyas from his arms, the Vaisyas from his belly and thighs, and the Sudras from his feet. The Brahman represents religion; the Kshatriya, war; the Vaisya, commerce and wealth; and the Sudra, labor. There are many subdivisions of caste, and although the Sudras are degraded far below the Brahmans, Kshatriyas, and Vaisyas, there are reckoned thirty-six subdivisions lower than the Sudras. Lowest of all are the Pariahs, who are supposed to be of no caste, and mere outcasts from humanity. Of the castes, the first three are the natural and gradually established divisions of the Aryan invaders and conquerors of India; the fourth was made up of the subjugated aborigines. The Sanskrit name for caste is *varna*, color, the different castes having been at first marked by differences of complexion, according to race, and in some degree according to occupation and consequent exposure. Besides the original castes, numerous mixed classes or castes have sprung up in the progress of time, and are dependent upon trade, occupation, or profession; in fact, the essential principle in the system of caste is the confining of employments to hereditary classes. Castes are, according to Indian social standards, either "high" or "low." The same term is also used of somewhat similar classes in other countries.

The system of *caste* involves the worst of all wrongs to humanity—that of hallowing evil by the authority and sanction of religion. *Faiths of the World*, p. 30.

To be subjugated by an inferior *caste* was a degradation beyond all other degradation. *Macaulay*, Hist. Eng.

Offensive as is the *low-caste* Indian, . . . I had rather see the lowest Pariahs of the low, than a single trim, smooth-faced, smooth-wayed, clever *high-caste* Hindoo on my lands or in my colony.
W. G. Palgrave, in Fortnightly Rev.

Hence—2. A division of society, or the principle of grading society, according to external conditions; a class or grade separated from others by differences of wealth, hereditary rank or privileges, or by profession or employment.

Where the operations became hereditary, a system of *castes* arose. This system has never been rigid in Western Europe, however, as it has been in India and other countries of the East.

Chilled casting, a casting which has been chilled, either by casting it in contact with something which will rapidly conduct heat from it, as a cool iron mold, or by sudden cooling from high temperatures by exposure to air or water. The effect, in the case of iron, is to produce a surface of great hardness which will withstand wear. Such castings are used for many purposes, as for railroad car-wheels, rolls, anvils, jaws of crushing-machines, stamps, etc.—**Cliché casting**. See *cliché*.—**Compression casting**, a method of casting in molds of potters' clay, with sufficient pressure to force the metal into the most delicate tracery left by the pattern. It is used in casting stamps, letters and numbers for houses, house-builders' hardware, etc.—**Dry casting**, a method of casting in which the molds are made of sand and afterward dried.

casting-pit (kȧs'ting-pit), *n.* The space in a foundry in which the molds are placed and the castings made. In Bessemer and open-hearth steel-works the casting-pit is the space utilized for casting the molten steel into the cast-iron ingot-molds. In modern practice these ingot-molds are carried on carefully covered iron cars, which are brought in at one end of the casting-pit and led out at the other end, on tracks, carrying the solidifying steel ingot.

casting-pot (kȧs'ting-pot), *n.* A pot or crucible of plumbago, fire-clay, or other material, in which metals or other fusible substances are melted.

Its top is a large polished plate of metal, commonly iron, having metal flanges of the same depth as the thickness of the glass, to keep the glass from running off at the sides. A massive copper cylinder extends entirely across the table, resting on the side flanges, and this, being set in motion, spreads the glass out into a sheet of uniform breadth and thickness.

casting-vote (kȧs'ting-vōt'), *n.* The vote of a presiding officer in an assembly or council, thrown to decide a question when the votes cast by the members are equally divided. If the presiding officer is a member of the body, he may give the casting-vote, although he has, by already voting as a member, created the tie or equal division. [Commonly written as two words.]

★**cast-iron** (kâst′ī″ėrn), *n.* and *a.* **I.** *n.* Iron which has been cast, that is, melted and run into a mold in which it assumes the desired form. Most cast-iron is pig-iron which has been remelted in a cupola furnace; but some castings for special purposes are made by remelting in a reverberatory furnace, and occasionally direct from the blast-furnace. The iron made from ore by smelting in the blast-furnace is in fact cast-iron, and its properties are not altered by remelting, but it is commonly known as *pig-iron*, or simply as *pig*. See *foundry* and *iron*.

II. *a.* **1.** Made of cast-iron: as, a *cast-iron* pot.—**2.** Having the qualities of or resembling cast-iron; hence, inflexible; unyielding: as, a *cast-iron* rule.

Castles, in the sense of fortified residences, were an outgrowth or institution of feudalism, and were first brought to a high pitch of strength and completeness by the Normans. In England there were few

or no castles, properly speaking, till the time of William the Conqueror, after which a great many were constructed on the Norman model. At first the donjon or keep was the only part of the castle of great strength, and the other buildings in connection with it were of a more or less temporary nature. In the thirteenth century, however, the design of the castle became more fully developed, and the keep formed only the central part of a group of buildings, all supporting one another, and mutually contributing to the strength and commodiousness of the whole. The cut shows the castle of Coucy, near Laon, France, built in the thirteenth century. In the foreground is the outer bailey or esplanade, fortified, and containing a chapel, stables, and other buildings. The outer entrance to this was formed by a barbican or antemural (see plan under *antemural*). *a* is the foss, 20 yards broad; *b*, the gate, approached by two swing-bridges, defended by two guard-rooms, and having a double portcullis within, giving entrance to vaulted guard-rooms with sleeping-apartments, etc., above, *c*; *d*, inner bailey or courtyard; *e*, covered buildings for the men defending the walls or curtains; *f*, apartments for the family, entered by the grand staircase, *g*; *h*, great hall, with storerooms and vaults below; *i*, donjon or keep (the chapel is seen behind it), the strongest part of the castle, with walls of immense thickness, suited to form the last retreat of the garrison. At *k* is a postern leading from the donjon and communicating with an outer postern, drawbridge, etc.; *l, m, n, o* are the chief towers flanking the outer walls.

At the foot of the Mount Syon is a faire *Castelle* and a strong, that the Soudan leet make.
Mandeville, Travels, p. 92.

Our *castle's* strength
Will laugh a siege to scorn.

The house of every one is to him as his *castle* and fortress, as well for defence against injury and violence as for his repose.
Sir E. Coke, Reports, Semayne's Case, v. fol. 91a.

2. In *her.*, a representation of two or more towers connected by curtains, often having a gateway in one of the curtains, and always embattled. When the towers are represented with the windows and the joints between the stones of colors different from that of the wall, they are said to be masoned or windowed *gules, or*, or the like. When the windows are shown of the color of the field, the castle is said to be *voided of the field*, or sometimes *ajouré*. The door is called the *port;* if it has a portcullis, this and its color are mentioned in the blazon.

3. The house or mansion of a person of rank or wealth: somewhat vaguely applied, but usually to a large and more or less imposing building.—**4.** A piece made in the form of a castle, donjon, or tower, used in the game of chess; the rook.—**5.** A kind of helmet.—**6.** *Naut.*, a kind of fighting-tower formerly erected on war-galleys, etc., near the bow and stern, and called respectively *forecastle* and *aftcastle*. See cut under *cadenas*.—**A castle in the air,** or **in Spain,** a visionary project; a vague imagination of possible wealth, fame, happiness, or the like; a day-dream. (See below.)—**To build castles in Spain,** to build castles in the air. (See below.) The origin of this phrase (which is traced back in French literature to the thirteenth century, and in English to the fourteenth) is doubtful. It has been attributed to the boasting by Spanish adventurers in France of their lordly residences, which existed only in their imaginations; and less probably to a supposed prohibition at some time against the erection of fortifications in Spain. Littré thinks the idea is simply that of an imaginary castle in any foreign country, other names having been similarly used, and that of Spain prevailing as most familiar; to which may be added that its real origin is probably to be found in the notion, always prevalent, of the attainment of great wealth through emigration or foreign adventure.

Thou shalt make *castels* thanne *in Spayne*,
And dreme of joye, alle but in vayne.
Rom. of the Rose, l. 2573.

To build (or **make†**) **castles in the air,** to form schemes that have no practical foundation; entertain projects that cannot be carried out; indulge, either seriously or in mere play of the imagination, in pleasing day-dreams, especially of great wealth or power.

The oil is obtained from the seeds by bruising them between rollers and then pressing them in hempen bags in a strong press. The oil that first comes away, called *cold-drawn castor-oil*, is reckoned the best; an inferior quality is obtained by heating or steaming the pressed seeds, and again subjecting them to pressure. The oil is afterward heated to the boiling-point, in order to separate the albumen and impurities. Castor-oil is used medicinally as a mild but efficient purgative. It is also used as a fixing agent in cotton-dyeing, especially in dyeing a Turkey-red color from madder. In its saponified state it is sold under various names, as *Turkey-red oil, alizarin oil, sulphated oil, soluble oil*, etc.—**Castor-oil plant**, the plant *Ricinus communis*, which produces castor-oil. It is often cultivated for ornament under the name of *Palma Christi*, grows to a height of 6 or 8 feet or more, with broad palmate leaves, and varies much in the color of its stem, leaves, etc.

Casual ejector, in *law*, the name given to the defendant in the fictitious action of ejectment formerly allowed by the common law, where the real object of the action was to determine a title to land. To form the ground of such an action, the person laying claim to the land granted a lease of it to a fictitious person, usually designated John Doe, and an action was then brought in the name of John Doe against another fictitious person, usually designated Richard Roe (the casual ejector), who was stated to have illegally ejected John Doe from the land which he held on lease. The landholder was permitted to defend in place of Richard Roe, and thus the determination of the action involved the proving of the lessor's right to grant a lease. L. *cluere*, cleanse.] **1.** A deluge or an overflowing of water; a flood; specifically, the Noachian flood. — **2.** In *geol.*, an inundation or deluge, or other violent and sudden physical action of great extent, supposed to have been the efficient cause of various phenomena (as of the deposition of different formations of diluvium or drift) for which the gradual action of moderate currents, or that of ice, is considered to have been inadequate.

This war is no accident, but an inevitable result of long-incubating causes; inevitable as the *cataclysms* that sweep away the monstrous births of primeval nature.
O. W. Holmes, Old Vol. of Life, p. 82.

3. Figuratively, a sudden or violent action of overwhelming force and extended sweep.

In minds accustomed to philosophic thought a change of opinion does not come by abrupt *cataclysm*, but by gradual development. *J. R. Seeley*, Nat. Religion, p. 231.

The question is not yet settled whether they [elevations and subsidences] were of a slow and gradual nature like some now in progress, or whether, like others that have occurred in connection with earthquakes, they may have been rapid and *cataclysmal*.
J. W. Dawson, Nature and the Bible, p. 161.

The French Revolution has been so often lifted by sensational writers into the region of *cataclysmal* and almost superhuman occurrences, that a narrative is especially acceptable which tends to range it among the facts which appeal to our ordinary experience.
Westminster Rev., CXXV. 568.

2. Of or pertaining to cataclysmists; holding the doctrine of violent upheavals: as, the *cataclysmal* school of geologists.

★**cataclysmic** (kat-a-kliz'mik), *a.* [< *cataclysm* + *-ic*; = F. *cataclysmique*.] Pertaining to, of the nature of, or characterized by cataclysms.

In the reign of his [Frederick's] grandnephew, whose evil lot fell on the *cataclysmic* times of Napoleon.
Lowe, Bismarck, I. 43.

There has always been in Geology a tendency to *cataclysmic* theories of causation; a proneness to attribute the grand changes experienced by the earth's crust to extraordinary causes. *J. Croll*, Climate and Cosmology, p. 11.

cataclysmist (kat-a-kliz'mist), *n.* [< *cataclysm* + *-ist*.] One who believes that many important geological phenomena are due to cataclysms.

Dan. *katakomb* = Russ. *katakombui*, pl., < F. *catacombe* = Pr. *cathacumba* = Sp. *catacumba* = Pg. *catacumba* (usually in plural), < It. *catacomba* (Sp. also occasionally *catatumba*, It. dial. *catatomba*, simulating Sp. *tumba*, It. *tomba*, tomb: see *tomb*), < ML. *catacumba*, a sepulchral vault, LL. *catacumbas*, *catecumbas*, *catecumpas*, in full *cimeterium catecumbas*; origin undetermined.] Originally, the name of a locality near Rome (in the fourth century) in which the church of St. Sebastian, with extensive burial-vaults, was built; but afterward applied to the vaults themselves, and to similar underground burial-places. The most celebrated of these subterranean vaults are those in and about this spot, the work of the early Christians. They consist of a labyrinth of narrow galleries, from 4 to 5 feet wide, at different levels, excavated in the soft granular tufa underlying the Campagna. In each wall loculi, or berth-like recesses, contained the bodies of the dead. The entrances to these were closed with slabs of stone, carefully sealed, and marked with inscriptions or rude pictures. In some cases small rooms, called *cubicula*, were set apart for families of distinction in the church, especially for martyrs. Though

these catacombs probably served to some extent as places of refuge and concealment for Christians during the earlier persecutions, the original idea of their construction was undoubtedly that they should be used only as burial-vaults. The length of the galleries in the Roman catacombs has been variously estimated at from 350 to 900 miles, and the number of bodies there interred is said to be over 6,000,000. Similar underground burial-places are found at Naples, Cairo, Paris, etc. Those of Paris are abandoned quarries extending under a large portion of the city, to which in 1786, when the intramural cemeteries of the city were condemned, the bones were removed.

In the middle ages it was common to erect a canopy upon this, covering the coffin; the whole structure was made somewhat to resemble an ecclesiastical edifice of the style then prevailing, and was allowed to remain for some little time after the ceremony. The modern catafalque is generally without a canopy, and in Roman Catholic countries is surrounded by large tapers, which are burned during a day or two preceding the burial. The catafalque is sometimes used as a hearse in carrying the body to the grave or tomb at a public or ceremonious funeral.

The tomb was a simple *catafalque*, covered with the usual cloth. *R. F. Burton*, El-Medinah, p. 471.

Līfe ĭs | būt ăn | ēmptў | drēam!

Verses consisting of feet of three or more syllables are described as *catalectic* in a *syllable*, a *disyllable*, or a *trisyllable*, according to the number of syllables in the last or incomplete foot.

If the first half of the line has its 12 short times, the second or *catalectic* part would seem to have but 11; but Aristoxenus, as we have seen, rejects the foot of 11 shorts as being unrhythmical. *J. Hadley*, Essays, p. 105.

(*b*) In a wider sense, wanting part of a foot or measure: as, a *catalectic* colon; a verse doubly *catalectic*. See *brachycatalectic*, *dicatalectic*, *hypercatalectic*, and *procatalectic*.

$$\begin{matrix} a, & b, & c, & d \\ b, & c, & d, & e \\ c, & d, & e, & f \\ d, & e, & f, & g, \end{matrix}$$

Catalexis is not the suppression of any rhythmical element, but the want of a corresponding syllable or syllables in the words to fill out a time (mora) or times necessary to the metrical completeness of the line. This space is filled out by a pause—in the quantitative poetry of the Greeks and Romans, either by a pause or by prolonging the preceding syllable.

Lines therefore will be so divided into feet that the ictus shall always fall on the first syllable of each foot, admitting anacrusis and *catalexis* wherever necessary.
Trans. Amer. Philol. Ass., XVI. 84.

Catalogue raisonné (F., literally reasoned catalogue), a catalogue of books, paintings, or the like, classed according to their subjects, usually with more or less full comments or explanations. = Syn. *List*, *Catalogue*. *List* means a mere enumeration of individual persons or articles, while *catalogue* properly supposes some description, with the names in a certain order. Thus we speak of a subscription *list*, but of the *catalogue* of a museum or a library.

[*cap.*] [NL.] A small genus of bignoniaceous trees, with large simple leaves, terminal panicles of showy flowers, and long linear pods with winged seeds. The species *C. Catalpa* and *C. speciosa* are natives of the United States, and are common in cultivation as ornamental trees. The wood is light and soft, but durable, and is much used for railroad-ties, fence-posts, etc. The bark is bitter, and has been employed as a vermifuge. 2. The causing or accelerating of a chemical change by contact or admixture with a substance which is itself not consumed or permanently affected by the chemical change. See *catalytic agent* and *catalytically*. Catalysis has been shown in many, but not all, cases to be due to the temporary formation of a compound between the catalyzer and one of the reacting substances, which compound then reacts more readily than the original substance with the other reacting substance in such a way as to regenerate the catalyzer and give rise to the ordinary product of the reaction. —**Negative catalysis**, the retardation of a chemical change by admixture with a substance which is itself not consumed or permanently affected thereby.

catalysotype (kat-a-lis′ō-tīp), *n.* [Irreg. < *catalysis* + *type*.] In *photog.*, a calotype process in which iron iodide is used in the preparation of the paper, in place of potassium iodide.

The most important classes of catalytic agents are: (1) solid contact agents, for example, finely divided platinum in causing the union of oxygen and sulphur dioxid gases or the decomposition of hydrogen peroxid in solution; (2) carriers, or substances which are known to act by forming with one of the reacting substances an intermediate compound which then acts upon the other substance, regenerating the catalyzer; (3) water, which even in minute amount often causes reactions to take place which do not occur at all between the dry substances, as the combustion of sodium in chlorin; (4) acids and bases in aqueous solution, which accelerate many hydration-reactions; (5) enzyms or unorganized ferments, each of which has a specific effect in causing the hydration, oxidation, reduction, splitting, or synthesis of some organic substance or group of substances.

catalytical (kat-a-lit′i-kal), *a.* Same as *catalytic*.

catalytically (kat-a-lit′i-kal-i), *adv.* In a catalytic manner; as a catalytic agent.

Platinum black . . . absorbs 800 times its volume of oxygen from the air, and in virtue thereof is a most active oxidizing agent, which, in general, acts *catalytically*, because the black, after having given up its oxygen to the oxidizable substance present, at once takes up a fresh supply from the atmosphere. *Encyc. Brit.*, XIX. 191.

It consists usually of several pieces of wood lashed together, the middle piece or pieces being longer than the others, and having one end turned up in the form of a bow. It is used on the coasts of Coromandel, and particularly at Madras, for conveying letters, messages, etc., through the surf to the shipping in the roads. Catamarans are also used in short navigations along the sea-shore in the West Indies, and on the coast of South America very large ones are employed. The name was also applied to the flat-bottomed fire-boats built by the English in 1804, and despatched, without success, against the French flotilla collected in Boulogne and neighboring harbors for the invasion of England.

Catapult.

Its construction is nowhere explained with any fullness, and it is uncertain whether its action was that of a crossbow or whether springs were the propelling power. By later authors the catapult and ballista seem to be confounded. In the middle ages the name is hardly used, except where a writer is evidently seeking to give a classical form to his composition. In the annexed cut, which represents a catapult of the later period when no distinction was made between it and the ballista, *F* is the end of a strong lever, which revolves on an axis and is held down by a windlass, *A*. At the extremity is a fork, *E E*, with the prongs curving slightly upward so as to afford a bed for a barrel of combustible matter or a heavy missile confined by a rope with a loop at the end, the loop being passed through a hook, *D*. When the lever was released it bounded suddenly upward, the centrifugal force causing the loop *C* to slip off the hook, whereupon the barrel held on the fork was liberated and projected toward its object. *B* shows rings of iron, stone, or lead, intended to increase the rebound due to the stretched cables or other devices which furnished the propelling force.

Bring up the *catapults*, and shake the wall.

3. A disease of the eye, characterized by opacity of the lens. A *secondary cataract* is one due to an earlier disease of the eye. Cataracts are probably incurable except by surgical treatment. The arrangement of actions or interconnection of causes which constitutes the final event of a dramatic piece; the unfolding and winding up of the plot, clearing up difficulties, and closing the play; the dénouement. 3. In *geol.*, an occurrence of geological importance not in harmony with preceding events, and not the result of causes acting always in a given direction; a cataclysm. It was once generally believed that the earth has "undergone a succession of revolutions and aqueous *catastrophes* interrupted by long intervals of tranquillity" (*Lyell*). The deluge was one of these great catastrophes. A similar view is the once common idea that all the living organisms on the earth's surface had been again and again exterminated, to be succeeded by new creations of plants and animals.

Great changes of a kind and intensity quite different from the common course of events, and which may therefore properly be called *catastrophes*, have taken place upon the earth's surface. *Whewell.*

The old notion of all the inhabitants of the earth having been swept away by *catastrophes* at successive periods is very generally given up, even by those geologists, as Élie de Beaumont, Murchison, Barrande, etc., whose general views would naturally lead them to this conclusion.

catastrophism (ka-tas'trō-fizm), *n.* [< *catastrophe* + *-ism*; = F. *catastrophisme*.] The theoretical view of geological events which has as its essential basis the idea of a succession of catastrophes: the opposite of *uniformitarianism*. See *catastrophe*, 3, and *cataclysm*, 2.

I find three, more or less contradictory, systems of geologic thought, each of which might fairly enough claim these appellations, standing side by side in Britain. I shall call one of them *Catastrophism*, another Uniformitarianism, the third Evolutionism. By *Catastrophism*, I mean any form of geological speculation which, in order to account for the phenomena of geology, supposes the operation of forces different in their nature, or immeasurably different in power, from those which we at present see in action in the universe. *Huxley*, Lay Sermons, p. 229.

catastrophist (ka-tas'trō-fist), *n.* [< *catastrophe* + *-ist*.] One who believes in catastrophism; a cataclysmist. The term is used in geology by writers on theoretical dynamic geology as the opposite of *uniformitarian*, that is, of one who considers that geological causes now in action are, and have been, essentially the same from the beginning. The catastrophist maintains that there have been catastrophes, or sudden violent changes in the order of nature, such, for instance, as would cause the extermination of all forms of life upon the globe, or cover it with ice.

The *catastrophist* is affirmative, the uniformitarian is negative in his assertions. *Whewell.*

For a generation after geologists had become uniformitarians in Geology, they remained *catastrophists* in Biology. *H. Spencer*, Data of Ethics, § 17.

In *logic*, a highest notion, especially one derived from the logical analysis of the forms of proposition. The word was introduced by Aristotle, who applies it to his ten predicaments, things said, or summa genera, viz., substance, quantity, quality, relation, action, passion, where, when, posture or relative position of parts, habit or state. These are derived from such an analysis of the proposition as could be made before the developed study of grammar. The *categories* or highest intellectual concepts of Kant are: *categories of quantity*—unity, plurality, totality; *categories of quality*—reality, negation, limit between these; *categories of relation*—substance and accident, cause and effect, action and reaction; *categories of modality*—possibility, impossibility, actuality, non-actuality, necessity, non-necessity. Modern formal logic furnishes this list: (1) qualities, or singular characters; (2) simple relations, or dual characters; (3) complex relations, or plural characters. Many lists of categories have been given not founded on formal logic.

Guernsey dial. *catte-pelaeure*, a woodlouse, a weevil, otherwise by the assibilated forms OF. *chatepelose*, *chatepelouse*, *chattepelouse*, *chatepeleuse*, *chattepelleuse*, also *chateplue*, a caterpillar, also a weevil, a mite, mod. dial. (Picard) *capleuse*, *capeluche*, *caplure*, *carplure*, (Norm.) *carplouse*, (Bret.) *charpelouse*; appar. F. *chatte*, f., a cat, + **peleure*, *pilleure*, *pilleuse* (Palsgrave), F. dial. *pilure*, *pélure*, a pill, < L. *pilula*, > also E. *pill*[1]: 'cat' being a fanciful name applied to the caterpillar (cf. It. dial. *gatta*, *gattola*, a caterpillar, < *gatto*, a cat; G. dial. (Swiss) *teufelskatz* (lit. devil's cat), a caterpillar; F. *chenille*, a caterpillar (see *chenille*), < L. *canicula*, a little dog), and 'pill' having reference to its rolling itself up in a little ball (cf. E. *pill-bug* and *pill-beetle*).] 1. Properly, the larva of a lepidopterous insect, but also applied to the larvæ of other insects, such as members of the family *Tenthredinidæ*, or saw-flies. Caterpillars are produced immediately from the egg; they are furnished with three pairs of true feet and a number of fleshy abdominal legs named *prolegs*, and have the shape and appearance of a worm. The old idea of Swammerdam that the pupa and imago are already concealed under the skin of the caterpillar is only partially founded in truth. The pupal skin is formed from the hypodermis of the larva, and the muscles contract and change its form. The larval skin is then thrown off, and the insect remains quiescent for some time, the imago or perfect insect forming beneath the pupal envelop. Caterpillars generally feed on leaves or succulent vegetables, and are sometimes very destructive. See *larva*. 2. A cockchafer. [Prov. Eng.]—3†.
